Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H leaf function to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-M" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*). Table B-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

**Table B-1. CPUID Signature Values of DisplayFamily\_DisplayModel**

| DisplayFamily_DisplayModel | Processor Families/Processor Number Series                                                                                                                                                                                         |

| 06_03H, 06_05H                | Intel Pentium II Xeon Processor, Intel Pentium II Processor                                            |
| 06_01H                        | Intel Pentium Pro Processor                                                                            |
| 05_01H, 05_02H, 05_04H        | Intel Pentium Processor, Intel Pentium Processor with MMX Technology                                   |

## B.1 ARCHITECTURAL MSRS

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these “architectural MSRs” were given the prefix “IA32\_”. Table B-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table B-2 and certain bitfields in an MSR address that may overlap with architectural MSR addresses are model-specific. Code that accesses a machine specified MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table B-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of “DF\_DM” (see Table B-1) or via CPUID flags.

## MODEL-SPECIFIC REGISTERS (MSRs)

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as "MAXPHYWID" in Table B-2. "MAXPHYWID" is reported by CPUID.8000\_0008H leaf.

MSR address range between 40000000H - 400000FFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

**Table B-2. IA-32 Architectural MSRs**

| Register Address |         | Architectural MSR Name and bit fields<br>(Former MSR Name) | MSR/Bit Description                                                                                                                                                                                                      | Introduced as Architectural MSR |
|------------------|---------|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| Hex              | Decimal |                                                            |                                                                                                                                                                                                                          |                                 |
| 0H               | 0       | IA32_P5_MC_ADDR<br>(P5_MC_ADDR)                            | See Appendix B.12, "MSRs in Pentium Processors."                                                                                                                                                                         | Pentium Processor (05_01H)      |

### NOTES:

1. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
2. The \*\_ADDR MSRs may or may not be present; this depends on flag settings in IA32\_MC\_STATUS. See Section 15.3.2.3 and Section 15.3.2.4 for more information.

## B.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table B-3 lists model-specific registers (MSRs) for Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR

addresses are also included in Table B-3. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_0FH, see Table B-1.

MSRs listed in Table B-2 and Table B-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have the CPUID signature DisplayFamily\_DisplayModel of 06\_17H.

The column “Shared/Unique” applies to multi-core processors based on Intel Core microarchitecture. “Unique” means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. “Shared” means the MSR or the bit field in an MSR address governs the operation of both processor cores.

**Table B-3. MSRs in Processors Based on Intel Core Microarchitecture**

| Register Address |     | Register Name            | Shared/Unique | Bit Description                                                                                                                         |
|------------------|-----|--------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|

| Register Address |     | Register Name | Shared/Unique | Bit Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|-----|---------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |               |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                  |     |               |               | When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.1:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.                         |
|                  |     |               |               | 15:14 Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                  |     |               |               | 19 Shared Adjacent Cache Line Prefetch Disable. (R/W) When set to 1, the processor fetches the cache line that contains data currently required by the processor. When set to 0, the processor fetches cache lines that comprise a cache line pair (128 bytes). Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit. |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

| Register Address |     | Register Name           | Shared/ Unique | Bit Description                                                                     |
|------------------|-----|-------------------------|----------------|-------------------------------------------------------------------------------------|
| Hex              | Dec |                         |                |                                                                                     |
| 309H             | 777 | IA32_FIXED_CTR0         | Unique         | Fixed-Function Performance Counter Register 0. (R/W) see Table B-2                  |
| 309H             | 777 | MSR_PERF_FIXED_CTR0     | Unique         | Fixed-Function Performance Counter Register 0. (R/W)                                |
| 30AH             | 778 | IA32_FIXED_CTR1         | Unique         | Fixed-Function Performance Counter Register 1. (R/W) see Table B-2                  |
| 30AH             | 778 | MSR_PERF_FIXED_CTR1     | Unique         | Fixed-Function Performance Counter Register 1. (R/W)                                |
| 30BH             | 779 | IA32_FIXED_CTR2         | Unique         | Fixed-Function Performance Counter Register 2. (R/W) see Table B-2                  |
| 30BH             | 779 | MSR_PERF_FIXED_CTR2     | Unique         | Fixed-Function Performance Counter Register 2. (R/W)                                |
| 345H             | 837 | IA32_PERF_CAPABILITIES  | Unique         | see Table B-2. See Section 16.4.1, "IA32_DEBUGCTL MSR."                             |
| 345H             | 837 | MSR_PERF_CAPABILITIES   | Unique         | RO. This applies to processors that do not support architectural perfmon version 2. |
|                  |     | 5:0                     |                | LBR Format. see Table B-2.                                                          |
|                  |     | 6                       |                | PEBS Record Format.                                                                 |
|                  |     | 7                       |                | PEBSSaveArchRegs. see Table B-2.                                                    |
|                  |     | 63:8                    |                | Reserved.                                                                           |
| 38DH             | 909 | IA32_FIXED_CTR_CTRL     | Unique         | Fixed-Function-Counter Control Register. (R/W) see Table B-2                        |
| 38DH             | 909 | MSR_PERF_FIXED_CTR_CTRL | Unique         | Fixed-Function-Counter Control Register. (R/W)                                      |
| 38EH             | 910 | IA32_PERF_GLOBAL_STAUS  | Unique         | see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."             |
| 38EH             | 910 | MSR_PERF_GLOBAL_STAUS   | Unique         | See Section 30.4.2, "Global Counter Control Facilities."                            |
| 38FH             | 911 | IA32_PERF_GLOBAL_CTRL   | Unique         | see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."             |
| 38FH             | 911 | MSR_PERF_GLOBAL_CTRL    | Unique         | See Section 30.4.2, "Global Counter Control Facilities."                            |

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

| Register Address |      | Register Name             | Shared/Unique | Bit Description                                                                                                                                                                                                                                                                                               |
|------------------|------|---------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                           |               |                                                                                                                                                                                                                                                                                                               |
| 390H             | 912  | IA32_PERF_GLOBAL_OVF_CTRL | Unique        | see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."                                                                                                                                                                                                                                       |
| 390H             | 912  | MSR_PERF_GLOBAL_OVF_CTRL  | Unique        | See Section 30.4.2, "Global Counter Control Facilities."                                                                                                                                                                                                                                                      |
| 3F1H             | 1009 | MSR_PEBS_ENABLE           | Unique        | see Table B-2. See Section 30.4.4, "Precise Event Based Sampling (PEBS)."                                                                                                                                                                                                                                     |
|                  |      | 0                         |               | Enable PEBS on IA32_PMCO. (R/W)                                                                                                                                                                                                                                                                               |
| 400H             | 1024 | IA32_MCO_CTL              | Unique        | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                    |
| 401H             | 1025 | IA32_MCO_STATUS           | Unique        | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."                                                                                                                                                                                                                                                                 |
| 402H             | 1026 | IA32_MCO_ADDR             | Unique        | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 404H             | 1028 | IA32_MC1_CTL              | Unique        | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                    |
| 405H             | 1029 | IA32_MC1_STATUS           | Unique        | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."                                                                                                                                                                                                                                                                 |
| 406H             | 1030 | IA32_MC1_ADDR             | Unique        | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 408H             | 1032 | IA32_MC2_CTL              | Unique        | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                    |
| 409H             | 1033 | IA32_MC2_STATUS           | Unique        | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."                                                                                                                                                                                                                                                                 |

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

| Register Address |      | Register Name  | Shared/Unique | Bit Description                                                                                                                                                                                                                                                                                                             |
|------------------|------|----------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                |               |                                                                                                                                                                                                                                                                                                                             |
| 40AH             | 1034 | IA32_MC2_ADDR  | Unique        | <p>See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."</p> <p>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear.</p> <p>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.</p> |
| 40CH             | 1036 | MSR_MC4_CTL    | Unique        | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                                                  |
| 40DH             | 1037 | MSR_MC4_STATUS | Unique        | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."                                                                                                                                                                                                                                                                               |
| 40EH             | 1038 | MSR_MC4_ADDR   | Unique        | <p>See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."</p> <p>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear.</p> <p>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.</p>   |

| 415H             | 1045 | MSR_MC5_STATUS | Unique        |                                                                                                                                                                                                                                                                                                                             |

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

| Register Address |      | Register Name                       | Shared/Unique | Bit Description                                                                                                                           |
|------------------|------|-------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                                     |               |                                                                                                                                           |
| 416H             | 1046 | MSR_MC5_ADDR                        | Unique        |                                                                                                                                           |
| 417H             | 1047 | MSR_MC5_MISC                        | Unique        |                                                                                                                                           |
| 419H             | 1045 | MSR_MC6_STATUS                      | Unique        | Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 15.3.2.2, "IA32_Mci_STATUS MSRS." and Appendix E. |
| 480H             | 1152 | IA32_VMX_BASIC                      | Unique        | Reporting Register of Basic VMX Capabilities. (R/O) see Table B-2. See Appendix G.1, "Basic VMX Information"                              |
| 481H             | 1153 | IA32_VMX_PINBASED_CTLs              | Unique        | Capability Reporting Register of Pin-based VM-execution Controls. (R/O) see Table B-2. See Appendix G.3, "VM-Execution Controls"          |
| 482H             | 1154 | IA32_VMX_PRIMARYPROCESSORBASED_CTLs | Unique        | Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls"           |
| 483H             | 1155 | IA32_VMX_EXIT_CTLs                  | Unique        | Capability Reporting Register of VM-exit Controls. (R/O) see Table B-2. See Appendix G.4, "VM-Exit Controls"                              |
| 484H             | 1156 | IA32_VMX_ENTRY_CTLs                 | Unique        | Capability Reporting Register of VM-entry Controls. (R/O) see Table B-2. See Appendix G.5, "VM-Entry Controls"                            |
| 485H             | 1157 | IA32_VMX_MISC                       | Unique        | Reporting Register of Miscellaneous VMX Capabilities. (R/O) see Table B-2. See Appendix G.6, "Miscellaneous Data"                         |
| 486H             | 1158 | IA32_VMX_CRO_FIXED0                 | Unique        | Capability Reporting Register of CRO Bits Fixed to 0. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CRO"                      |
| 487H             | 1159 | IA32_VMX_CRO_FIXED1                 | Unique        | Capability Reporting Register of CRO Bits Fixed to 1. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CRO"                      |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

| Register Address |      | Register Name           | Shared/ Unique | Bit Description                                                                                                                                |
|------------------|------|-------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                         |                |                                                                                                                                                |
| 488H             | 1160 | IA32_VMX_CR4_F1_XED0    | Unique         | Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"                        |
| 489H             | 1161 | IA32_VMX_CR4_F1_XED1    | Unique         | Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"                        |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM      | Unique         | Capability Reporting Register of VMCS Field Enumeration. (R/O). see Table B-2.<br>See Appendix G.9, "VMCS Enumeration"                         |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTL2 | Unique         | Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls"           |
| 600H             | 1536 | IA32_DS_AREA            | Unique         | DS Save Area. (R/W). see Table B-2<br>See Section 30.9.4, "Debug Store (DS) Mechanism."                                                        |
| 107CC H          |      | MSR_EMON_L3_CTR_CTL0    | Unique         | GBUSQ Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2 |
| 107CD H          |      | MSR_EMON_L3_CTR_CTL1    | Unique         | GBUSQ Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2 |
| 107CE H          |      | MSR_EMON_L3_CTR_CTL2    | Unique         | GSNPQ Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2 |

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

| Register Address |     | Register Name        | Shared/Unique | Bit Description                                                                                                                                |
|------------------|-----|----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                      |               |                                                                                                                                                |
| 107CFH           |     | MSR_EMON_L3_CTR_CTL3 | Unique        | GSNPQ Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2 |
| 107D0H           |     | MSR_EMON_L3_CTR_CTL4 | Unique        | FSB Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2   |
| 107D1H           |     | MSR_EMON_L3_CTR_CTL5 | Unique        | FSB Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2   |
| 107D2H           |     | MSR_EMON_L3_CTR_CTL6 | Unique        | FSB Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2   |
| 107D3H           |     | MSR_EMON_L3_CTR_CTL7 | Unique        | FSB Event Control/Counter Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2   |
| 107D8H           |     | MSR_EMON_L3_GL_CTL   | Unique        | L3/FSB Common Control Register. (R/W).<br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2       |
| C000_0080H       |     | IA32_EFER            | Unique        | Extended Feature Enables. see Table B-2                                                                                                        |
| C000_0081H       |     | IA32_STAR            | Unique        | System Call Target Address. (R/W). see Table B-2                                                                                               |
| C000_0082H       |     | IA32_LSTAR           | Unique        | IA-32e Mode System Call Target Address. (R/W). see Table B-2                                                                                   |
| C000_0084H       |     | IA32_FMASK           | Unique        | System Call Flag Mask. (R/W). see Table B-2                                                                                                    |

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

| Register Address |     | Register Name       | Shared/Unique | Bit Description                                         |
|------------------|-----|---------------------|---------------|---------------------------------------------------------|
| Hex              | Dec |                     |               |                                                         |
| C000_0100H       |     | IA32_FS_BASE        | Unique        | Map of BASE Address of FS. (R/W). see Table B-2         |
| C000_0101H       |     | IA32_GS_BASE        | Unique        | Map of BASE Address of GS. (R/W). see Table B-2         |
| C000_0102H       |     | IA32_KERNEL_GS_BASE | Unique        | Swap Target of BASE Address of GS. (R/W). see Table B-2 |

### B.3 MSRS IN THE INTEL® ATOM™ PROCESSOR FAMILY

Table B-4 lists model-specific registers (MSRs) for Intel Atom processor family, architectural MSR addresses are also included in Table B-4. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_1CH, see Table B-1.

The column “Shared/Unique” applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. “Unique” means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. “Shared” means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

Table B-4. MSRs in Intel Atom Processor Family

| Register Address |     | Register Name            | Shared/Unique | Bit Description                                                                |
|------------------|-----|--------------------------|---------------|--------------------------------------------------------------------------------|
| Hex              | Dec |                          |               |                                                                                |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

| Register Address |     | Register Name    | Shared/<br>Unique | Bit Description                                                                                                                                                                                                                                                     |
|------------------|-----|------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                  |                   |                                                                                                                                                                                                                                                                     |
|                  |     | 0                |                   | RIPV.<br>When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted                      |
|                  |     | 1                |                   | EIPV.<br>When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.                                                                        |
|                  |     | 2                |                   | MCIP.<br>When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception. |
|                  |     | 63:3             |                   | Reserved.                                                                                                                                                                                                                                                           |

| 400H             | 1024 | IA32_MCO_CTL              | Shared        | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                 |
| 401H             | 1025 | IA32_MCO_STATUS           | Shared        | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                              |
| 402H             | 1026 | IA32_MCO_ADDR             | Shared        | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 404H             | 1028 | IA32_MCI_CTL              | Shared        | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                 |
| 405H             | 1029 | IA32_MCI_STATUS           | Shared        | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                              |
| 408H             | 1032 | IA32_MC2_CTL              | Shared        | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                 |
| 409H             | 1033 | IA32_MC2_STATUS           | Shared        | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                              |

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

| Register Address |      | Register Name          | Shared/<br>Unique | Bit Description                                                                                                                                                                                                                                                                                                             |
|------------------|------|------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                        |                   |                                                                                                                                                                                                                                                                                                                             |
| 40AH             | 1034 | IA32_MC2_ADDR          | Shared            | <p>See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."</p> <p>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear.</p> <p>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.</p> |
| 40CH             | 1036 | MSR_MC3_CTL            | Shared            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                                                  |
| 40DH             | 1037 | MSR_MC3_STATUS         | Shared            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."                                                                                                                                                                                                                                                                               |
| 40EH             | 1038 | MSR_MC3_ADDR           | Shared            | <p>See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."</p> <p>The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear.</p> <p>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.</p>   |
| 410H             | 1040 | MSR_MC4_CTL            | Shared            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                                                  |
| 411H             | 1041 | MSR_MC4_STATUS         | Shared            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."                                                                                                                                                                                                                                                                               |
| 412H             | 1042 | MSR_MC4_ADDR           | Shared            | <p>See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."</p> <p>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear.</p> <p>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.</p>   |
| 480H             | 1152 | IA32_VMX_BASIC         | Unique            | <p>Reporting Register of Basic VMX Capabilities. (R/O) see Table B-2.</p> <p>See Appendix G.1, "Basic VMX Information"</p>                                                                                                                                                                                                  |
| 481H             | 1153 | IA32_VMX_PINBASED_CTLS | Unique            | <p>Capability Reporting Register of Pin-based VM-execution Controls. (R/O) see Table B-2.</p> <p>See Appendix G.3, "VM-Execution Controls"</p>                                                                                                                                                                              |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

| Register Address |      | Register Name            | Shared/Unique | Bit Description                                                                                                                      |
|------------------|------|--------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                          |               |                                                                                                                                      |
| 482H             | 1154 | IA32_VMX_PROCBASED_CTLs  | Unique        | Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls"   |
| 483H             | 1155 | IA32_VMX_EXIT_CTLs       | Unique        | Capability Reporting Register of VM-exit Controls. (R/O) see Table B-2.<br>See Appendix G.4, "VM-Exit Controls"                      |
| 484H             | 1156 | IA32_VMX_ENTRY_CTLs      | Unique        | Capability Reporting Register of VM-entry Controls. (R/O) see Table B-2.<br>See Appendix G.5, "VM-Entry Controls"                    |
| 485H             | 1157 | IA32_VMX_MISC            | Unique        | Reporting Register of Miscellaneous VMX Capabilities. (R/O) see Table B-2.<br>See Appendix G.6, "Miscellaneous Data"                 |
| 486H             | 1158 | IA32_VMX_CRO_FIXED0      | Unique        | Capability Reporting Register of CRO Bits Fixed to 0. (R/O) see Table B-2.<br>See Appendix G.7, "VMX-Fixed Bits in CRO"              |
| 487H             | 1159 | IA32_VMX_CRO_FIXED1      | Unique        | Capability Reporting Register of CRO Bits Fixed to 1. (R/O) see Table B-2.<br>See Appendix G.7, "VMX-Fixed Bits in CRO"              |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0      | Unique        | Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"              |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1      | Unique        | Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"              |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM       | Unique        | Capability Reporting Register of VMCS Field Enumeration. (R/O). see Table B-2.<br>See Appendix G.9, "VMCS Enumeration"               |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTLs2 | Unique        | Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls" |

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

| Register Address |      | Register Name       | Shared/Unique | Bit Description                                                                         |
|------------------|------|---------------------|---------------|-----------------------------------------------------------------------------------------|
| Hex              | Dec  |                     |               |                                                                                         |
| 600H             | 1536 | IA32_DS_AREA        | Unique        | DS Save Area. (R/W). see Table B-2<br>See Section 30.9.4, "Debug Store (DS) Mechanism." |
| C000_0080H       |      | IA32_EFER           | Unique        | Extended Feature Enables. see Table B-2                                                 |
| C000_0081H       |      | IA32_STAR           | Unique        | System Call Target Address. (R/W). see Table B-2                                        |
| C000_0082H       |      | IA32_LSTAR          | Unique        | IA-32e Mode System Call Target Address. (R/W). see Table B-2                            |
| C000_0084H       |      | IA32_FMASK          | Unique        | System Call Flag Mask. (R/W). see Table B-2                                             |
| C000_0100H       |      | IA32_FS_BASE        | Unique        | Map of BASE Address of FS. (R/W). see Table B-2                                         |
| C000_0101H       |      | IA32_GS_BASE        | Unique        | Map of BASE Address of GS. (R/W). see Table B-2                                         |

## B.4 MSRS IN THE INTEL® MICROARCHITECTURE CODE NAME NEHALEM

Table B-5 lists model-specific registers (MSRs) that are common for Intel® microarchitecture code name Nehalem. These include Intel Core i7 and i5 processor family. Architectural MSR addresses are also included in Table B-5. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_1AH, 06\_1EH, 06\_1FH, 06\_2EH, see Table B-1. Additional MSRs specific to 06\_1AH, 06\_1EH, 06\_1FH are listed in Table B-6. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at <http://biosbits.org>.

The column "Scope" represents the package/core/thread scope of individual bit field of an MSR. "Thread" means this bit field must be programmed on each logical processor independently. "Core" means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. "Package" means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem

| Register Address |     | Register Name            | Scope   | Bit Description                                                                |
|------------------|-----|--------------------------|---------|--------------------------------------------------------------------------------|
| Hex              | Dec |                          |         |                                                                                |
| 0H               | 0   | IA32_P5_MC_ADDR          | Thread  | See Appendix B.12, "MSRs in Pentium Processors."                               |
| 1H               | 1   | IA32_P5_MC_TYPE          | Thread  | See Appendix B.12, "MSRs in Pentium Processors."                               |
| 6H               | 6   | IA32_MONITOR_FILTER_SIZE | Thread  | See Section 8.10.5, "Monitor/Mwait Address Range Determination." and Table B-2 |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER  | Thread  | See Section 16.12, "Time-Stamp Counter." and see Table B-2                     |
| 17H              | 23  | IA32_PLATFORM_ID         | Package | Platform ID. (R)<br>See Table B-2.                                             |
| 17H              | 23  | MSR_PLATFORM_ID          | Package | Model Specific Platform ID. (R)                                                |
|                  |     | 49:0                     |         | Reserved.                                                                      |
|                  |     | 52:50                    |         | See Table B-2.                                                                 |
|                  |     | 63:53                    |         | Reserved.                                                                      |
| 1BH              | 27  | IA32_APIC_BASE           | Thread  | See Section 10.4.4, "Local APIC Status and Location." and Table B-2            |
| 34H              | 52  | MSR_SMI_COUNT            | Thread  | SMI Counter. (R/O).                                                            |
|                  |     | 31:0                     |         | SMI Count. (R/O)<br>Count SMIs                                                 |
|                  |     | 63:32                    |         | Reserved.                                                                      |
| 3AH              | 58  | IA32_FEATURE_CONTROL     | Thread  | Control Features in Intel 64 Processor. (R/W).<br>see Table B-2                |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |     | Register Name           | Scope  | Bit Description |
|------------------|-----|-------------------------|--------|-----------------|
| Hex              | Dec |                         |        |                 |
| 207H             | 519 | IA32_MTRR_PHYS MASK3    | Thread | see Table B-2   |
| 208H             | 520 | IA32_MTRR_PHYS BASE4    | Thread | see Table B-2   |
| 209H             | 521 | IA32_MTRR_PHYS MASK4    | Thread | see Table B-2   |
| 20AH             | 522 | IA32_MTRR_PHYS BASE5    | Thread | see Table B-2   |
| 20BH             | 523 | IA32_MTRR_PHYS MASK5    | Thread | see Table B-2   |
| 20CH             | 524 | IA32_MTRR_PHYS BASE6    | Thread | see Table B-2   |
| 20DH             | 525 | IA32_MTRR_PHYS MASK6    | Thread | see Table B-2   |
| 20EH             | 526 | IA32_MTRR_PHYS BASE7    | Thread | see Table B-2   |
| 20FH             | 527 | IA32_MTRR_PHYS MASK7    | Thread | see Table B-2   |
| 210H             | 528 | IA32_MTRR_PHYS BASE8    | Thread | see Table B-2   |
| 211H             | 529 | IA32_MTRR_PHYS MASK8    | Thread | see Table B-2   |
| 212H             | 530 | IA32_MTRR_PHYS BASE9    | Thread | see Table B-2   |
| 213H             | 531 | IA32_MTRR_PHYS MASK9    | Thread | see Table B-2   |
| 250H             | 592 | IA32_MTRR_FIX6 4K_00000 | Thread | see Table B-2   |
| 258H             | 600 | IA32_MTRR_FIX1 6K_80000 | Thread | see Table B-2   |
| 259H             | 601 | IA32_MTRR_FIX1 6K_A0000 | Thread | see Table B-2   |

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |     | Register Name          | Scope   | Bit Description                                                    |
|------------------|-----|------------------------|---------|--------------------------------------------------------------------|
| Hex              | Dec |                        |         |                                                                    |
| 268H             | 616 | IA32_MTRR_FIX4_K_C0000 | Thread  | see Table B-2                                                      |
| 269H             | 617 | IA32_MTRR_FIX4_K_C8000 | Thread  | see Table B-2                                                      |
| 26AH             | 618 | IA32_MTRR_FIX4_K_D0000 | Thread  | see Table B-2                                                      |
| 26BH             | 619 | IA32_MTRR_FIX4_K_D8000 | Thread  | see Table B-2                                                      |
| 26CH             | 620 | IA32_MTRR_FIX4_K_E0000 | Thread  | see Table B-2                                                      |
| 26DH             | 621 | IA32_MTRR_FIX4_K_E8000 | Thread  | see Table B-2                                                      |
| 26EH             | 622 | IA32_MTRR_FIX4_K_F0000 | Thread  | see Table B-2                                                      |
| 26FH             | 623 | IA32_MTRR_FIX4_K_F8000 | Thread  | see Table B-2                                                      |
| 277H             | 631 | IA32_PAT               | Thread  | see Table B-2                                                      |
| 280H             | 640 | IA32_MCO_CTL2          | Package | see Table B-2                                                      |
| 281H             | 641 | IA32_MC1_CTL2          | Package | see Table B-2                                                      |
| 282H             | 642 | IA32_MC2_CTL2          | Core    | see Table B-2                                                      |
| 283H             | 643 | IA32_MC3_CTL2          | Core    | see Table B-2                                                      |
| 284H             | 644 | IA32_MC4_CTL2          | Core    | see Table B-2                                                      |
| 285H             | 645 | IA32_MC5_CTL2          | Core    | see Table B-2                                                      |
| 286H             | 646 | IA32_MC6_CTL2          | Package | see Table B-2                                                      |
| 287H             | 647 | IA32_MC7_CTL2          | Package | see Table B-2                                                      |
| 288H             | 648 | IA32_MC8_CTL2          | Package | see Table B-2                                                      |
| 2FFH             | 767 | IA32_MTRR_DEF_TYPE     | Thread  | Default Memory Types. (R/W) see Table B-2                          |
| 309H             | 777 | IA32_FIXED_CTR0        | Thread  | Fixed-Function Performance Counter Register 0. (R/W) see Table B-2 |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

| Register Address |      | Register Name             | Scope  | Bit Description                                                         |
|------------------|------|---------------------------|--------|-------------------------------------------------------------------------|
| Hex              | Dec  |                           |        |                                                                         |
| 30AH             | 778  | IA32_FIXED_CTR1           | Thread | Fixed-Function Performance Counter Register 1. (R/W) see Table B-2      |
| 30BH             | 779  | IA32_FIXED_CTR2           | Thread | Fixed-Function Performance Counter Register 2. (R/W) see Table B-2      |
| 345H             | 837  | IA32_PERF_CAPABILITIES    | Thread | see Table B-2. See Section 16.4.1, "IA32_DEBUGCTL MSR."                 |
|                  |      | 5:0                       |        | LBR Format. see Table B-2.                                              |
|                  |      | 6                         |        | PEBS Record Format.                                                     |
|                  |      | 7                         |        | PEBSSaveArchRegs. see Table B-2.                                        |

| 3F6H             | 1014 | MSR_PEBS_LD_LAT      | Thread  | see See Section 30.6.1.2, "Load Latency Performance Monitoring Facility."                                                                                   |
|                  |      | 15:0                 |         | Minimum threshold latency value of tagged load operation that will be counted. (R/W)                                                                        |
|                  |      | 63:36                |         | Reserved                                                                                                                                                    |
| 3F8H             | 1016 | MSR_PKG_C3_RESIDENCY | Package | Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.                           |
|                  |      | 63:0                 |         | Package C3 Residency Counter. (R/O)<br>Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC. |
| 3F9H             | 1017 | MSR_PKG_C6_RESIDENCY | Package | Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.                           |
|                  |      | 63:0                 |         | Package C6 Residency Counter. (R/O)<br>Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC. |
| 3FAH             | 1018 | MSR_PKG_C7_RESIDENCY | Package | Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.                           |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |      | Register Name        | Scope   | Bit Description                                                                                                                                                                                                                                                                                             |
|------------------|------|----------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                      |         |                                                                                                                                                                                                                                                                                                             |
|                  |      | 63:0                 |         | Package C7 Residency Counter. (R/O)<br>Value since last reset that this package is in processor-specific C7 states. Count at the same frequency as the TSC.                                                                                                                                                 |
| 3FCH             | 1020 | MSR_CORE_C3_RSIDENCY | Core    | Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.                                                                                                                                                                           |
|                  |      | 63:0                 |         | CORE C3 Residency Counter. (R/O)<br>Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.                                                                                                                                                       |
| 3FDH             | 1021 | MSR_CORE_C6_RSIDENCY | Core    | Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.                                                                                                                                                                           |
|                  |      | 63:0                 |         | CORE C6 Residency Counter. (R/O)<br>Value since last reset that this core is in processor-specific C6 states. Count at the same frequency as the TSC.                                                                                                                                                       |
| 400H             | 1024 | IA32_MCO_CTL         | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                  |
| 401H             | 1025 | IA32_MCO_STATUS      | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                               |
| 402H             | 1026 | IA32_MCO_ADDR        | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR flag in the IA32_MCO_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 403H             | 1027 | MSR_MCO_MISC         | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                 |
| 404H             | 1028 | IA32_MC1_CTL         | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                  |

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |      | Register Name   | Scope   | Bit Description                                                                                                                                                                                                                                                                                              |
|------------------|------|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                 |         |                                                                                                                                                                                                                                                                                                              |
| 405H             | 1029 | IA32_MC1_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                                |
| 406H             | 1030 | IA32_MC1_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 407H             | 1031 | MSR_MC1_MISC    | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                  |
| 408H             | 1032 | IA32_MC2_CTL    | Core    | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                   |
| 409H             | 1033 | IA32_MC2_STATUS | Core    | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                                |
| 40AH             | 1034 | IA32_MC2_ADDR   | Core    | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 40BH             | 1035 | MSR_MC2_MISC    | Core    | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                  |
| 40CH             | 1036 | MSR_MC3_CTL     | Core    | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                   |
| 40DH             | 1037 | MSR_MC3_STATUS  | Core    | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                                |
| 40EH             | 1038 | MSR_MC3_ADDR    | Core    | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |      | Register Name  | Scope   | Bit Description                                                                                                                                                                                                                                                                                            |
|------------------|------|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                |         |                                                                                                                                                                                                                                                                                                            |
| 40FH             | 1039 | MSR_MC3_MISC   | Core    | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                |
| 410H             | 1040 | MSR_MC4_CTL    | Core    | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                 |
| 411H             | 1041 | MSR_MC4_STATUS | Core    | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                              |
| 412H             | 1042 | MSR_MC4_ADDR   | Core    | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 413H             | 1043 | MSR_MC4_MISC   | Core    | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                |
| 414H             | 1044 | MSR_MC5_CTL    | Core    | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                 |
| 415H             | 1045 | MSR_MC5_STATUS | Core    | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                              |
| 416H             | 1046 | MSR_MC5_ADDR   | Core    | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                                                                                                                                                                                                                                                                |
| 417H             | 1047 | MSR_MC5_MISC   | Core    | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                |
| 418H             | 1048 | MSR_MC6_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                 |
| 419H             | 1049 | MSR_MC6_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.                                                                                                                                                                                                                                              |
| 41AH             | 1050 | MSR_MC6_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                                                                                                                                                                                                                                                                |
| 41BH             | 1051 | MSR_MC6_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                |

| 41EH             | 1054 | MSR_MC7_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                                                                                                                                                                                                                                                                |
| 41FH             | 1055 | MSR_MC7_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                                                                                                                                                                                                |
| 420H             | 1056 | MSR_MC8_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                                 |
| 421H             | 1057 | MSR_MC8_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.                                                                                                                                                                                                                                              |

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |      | Register Name               | Scope   | Bit Description                                                                                                                     |
|------------------|------|-----------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                             |         |                                                                                                                                     |
| 422H             | 1058 | MSR_MC8_ADDR                | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                                                                                         |
| 423H             | 1059 | MSR_MC8_MISC                | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                                                                                         |
| 480H             | 1152 | IA32_VMX_BASIC              | Thread  | Reporting Register of Basic VMX Capabilities. (R/O) see Table B-2.<br>See Appendix G.1, "Basic VMX Information"                     |
| 481H             | 1153 | IA32_VMX_PINBA<br>SED_CTLs  | Thread  | Capability Reporting Register of Pin-based VM-execution Controls. (R/O) see Table B-2.<br>See Appendix G.3, "VM-Execution Controls" |
| 482H             | 1154 | IA32_VMX_PROCB<br>ASED_CTLs | Thread  | Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls"  |
| 483H             | 1155 | IA32_VMX_EXIT_<br>CTLs      | Thread  | Capability Reporting Register of VM-exit Controls. (R/O) see Table B-2.<br>See Appendix G.4, "VM-Exit Controls"                     |
| 484H             | 1156 | IA32_VMX_<br>ENTRY_CTLs     | Thread  | Capability Reporting Register of VM-entry Controls. (R/O) see Table B-2.<br>See Appendix G.5, "VM-Entry Controls"                   |
| 485H             | 1157 | IA32_VMX_MISC               | Thread  | Reporting Register of Miscellaneous VMX Capabilities. (R/O) see Table B-2.<br>See Appendix G.6, "Miscellaneous Data"                |
| 486H             | 1158 | IA32_VMX_CRO_<br>FIXED0     | Thread  | Capability Reporting Register of CRO Bits Fixed to 0. (R/O) see Table B-2.<br>See Appendix G.7, "VMX-Fixed Bits in CRO"             |
| 487H             | 1159 | IA32_VMX_CRO_<br>FIXED1     | Thread  | Capability Reporting Register of CRO Bits Fixed to 1. (R/O) see Table B-2.<br>See Appendix G.7, "VMX-Fixed Bits in CRO"             |
| 488H             | 1160 | IA32_VMX_CR4_FI<br>XED0     | Thread  | Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"             |
| 489H             | 1161 | IA32_VMX_CR4_FI<br>XED1     | Thread  | Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"             |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |      | Register Name            | Scope  | Bit Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------|--------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                          |        |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM       | Thread | Capability Reporting Register of VMCS Field Enumeration. (R/O). see Table B-2.<br>See Appendix G.9, "VMCS Enumeration"                                                                                                                                                                                                                                                                                                                 |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTL32 | Thread | Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls"                                                                                                                                                                                                                                                                                                   |
| 600H             | 1536 | IA32_DS_AREA             | Thread | DS Save Area. (R/W). see Table B-2<br>See Section 30.9.4, "Debug Store (DS) Mechanism."                                                                                                                                                                                                                                                                                                                                                |
| 680H             | 1664 | MSR_LASTBRANCH_0_FROM_IP | Thread | Last Branch Record 0 From IP. (R/W)<br>One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the <b>source instruction</b> for one of the last sixteen branches, exceptions, or interrupts taken by the processor. See also: <ul style="list-style-type: none"><li>▪ Last Branch Record Stack TOS at 1C9H</li><li>▪ Section 16.6.1, "LBR Stack."</li></ul> |
| 681H             | 1665 | MSR_LASTBRANCH_1_FROM_IP | Thread | Last Branch Record 1 From IP. (R/W)<br>See description of MSR_LASTBRANCH_0_FROM_IP.                                                                                                                                                                                                                                                                                                                                                    |
| 682H             | 1666 | MSR_LASTBRANCH_2_FROM_IP | Thread | Last Branch Record 2 From IP. (R/W)<br>See description of MSR_LASTBRANCH_0_FROM_IP.                                                                                                                                                                                                                                                                                                                                                    |
| 683H             | 1667 | MSR_LASTBRANCH_3_FROM_IP | Thread | Last Branch Record 3 From IP. (R/W)<br>See description of MSR_LASTBRANCH_0_FROM_IP.                                                                                                                                                                                                                                                                                                                                                    |
| 684H             | 1668 | MSR_LASTBRANCH_4_FROM_IP | Thread | Last Branch Record 4 From IP. (R/W)<br>See description of MSR_LASTBRANCH_0_FROM_IP.                                                                                                                                                                                                                                                                                                                                                    |

| 6CAH             | 1738 | MSR_LASTBRANCH_10_TO_LIP | Thread | Last Branch Record 10 To IP. (R/W)<br>See description of MSR_LASTBRANCH_0_TO_LIP. |
| 6CBH             | 1739 | MSR_LASTBRANCH_11_TO_LIP | Thread | Last Branch Record 11 To IP. (R/W)<br>See description of MSR_LASTBRANCH_0_TO_LIP. |
| 6CCH             | 1740 | MSR_LASTBRANCH_12_TO_LIP | Thread | Last Branch Record 12 To IP. (R/W)<br>See description of MSR_LASTBRANCH_0_TO_LIP. |
| 6CDH             | 1741 | MSR_LASTBRANCH_13_TO_LIP | Thread | Last Branch Record 13 To IP. (R/W)<br>See description of MSR_LASTBRANCH_0_TO_LIP. |
| 6CEH             | 1742 | MSR_LASTBRANCH_14_TO_LIP | Thread | Last Branch Record 14 To IP. (R/W)<br>See description of MSR_LASTBRANCH_0_TO_LIP. |
| 6CFH             | 1743 | MSR_LASTBRANCH_15_TO_LIP | Thread | Last Branch Record 15 To IP. (R/W)<br>See description of MSR_LASTBRANCH_0_TO_LIP. |
| 802H             | 2050 | IA32_X2APIC_API CID      | Thread | x2APIC ID register (R/O) see x2APIC specification                                 |
| 803H             | 2051 | IA32_X2APIC_VERSION      | Thread | x2APIC Version register (R/O)                                                     |
| 808H             | 2056 | IA32_X2APIC_TPR          | Thread | x2APIC Task Priority register (R/W)                                               |
| 80AH             | 2058 | IA32_X2APIC_PPR          | Thread | x2APIC Processor Priority register (R/O)                                          |
| 80BH             | 2059 | IA32_X2APIC_EOI          | Thread | x2APIC EOI register (W/O)                                                         |
| 80DH             | 2061 | IA32_X2APIC_LDR          | Thread | x2APIC Logical Destination register (R/O)                                         |
| 80FH             | 2063 | IA32_X2APIC_SIV R        | Thread | x2APIC Spurious Interrupt Vector register (R/W)                                   |
| 810H             | 2064 | IA32_X2APIC_ISR 0        | Thread | x2APIC In-Service register bits [31:0] (R/O)                                      |
| 811H             | 2065 | IA32_X2APIC_ISR 1        | Thread | x2APIC In-Service register bits [63:32] (R/O)                                     |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |      | Register Name    | Scope  | Bit Description                                      |
|------------------|------|------------------|--------|------------------------------------------------------|
| Hex              | Dec  |                  |        |                                                      |
| 812H             | 2066 | IA32_X2APIC_ISR2 | Thread | x2APIC In-Service register bits [95:64] (R/O)        |
| 813H             | 2067 | IA32_X2APIC_ISR3 | Thread | x2APIC In-Service register bits [127:96] (R/O)       |
| 814H             | 2068 | IA32_X2APIC_ISR4 | Thread | x2APIC In-Service register bits [159:128] (R/O)      |
| 815H             | 2069 | IA32_X2APIC_ISR5 | Thread | x2APIC In-Service register bits [191:160] (R/O)      |
| 816H             | 2070 | IA32_X2APIC_ISR6 | Thread | x2APIC In-Service register bits [223:192] (R/O)      |
| 817H             | 2071 | IA32_X2APIC_ISR7 | Thread | x2APIC In-Service register bits [255:224] (R/O)      |
| 818H             | 2072 | IA32_X2APIC_TMR0 | Thread | x2APIC Trigger Mode register bits [31:0] (R/O)       |
| 819H             | 2073 | IA32_X2APIC_TMR1 | Thread | x2APIC Trigger Mode register bits [63:32] (R/O)      |
| 81AH             | 2074 | IA32_X2APIC_TMR2 | Thread | x2APIC Trigger Mode register bits [95:64] (R/O)      |
| 81BH             | 2075 | IA32_X2APIC_TMR3 | Thread | x2APIC Trigger Mode register bits [127:96] (R/O)     |
| 81CH             | 2076 | IA32_X2APIC_TMR4 | Thread | x2APIC Trigger Mode register bits [159:128] (R/O)    |
| 81DH             | 2077 | IA32_X2APIC_TMR5 | Thread | x2APIC Trigger Mode register bits [191:160] (R/O)    |
| 81EH             | 2078 | IA32_X2APIC_TMR6 | Thread | x2APIC Trigger Mode register bits [223:192] (R/O)    |
| 81FH             | 2079 | IA32_X2APIC_TMR7 | Thread | x2APIC Trigger Mode register bits [255:224] (R/O)    |
| 820H             | 2080 | IA32_X2APIC_IRR0 | Thread | x2APIC Interrupt Request register bits [31:0] (R/O)  |
| 821H             | 2081 | IA32_X2APIC_IRR1 | Thread | x2APIC Interrupt Request register bits [63:32] (R/O) |

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem  
(Contd.)

| Register Address |      | Register Name           | Scope  | Bit Description                                             |
|------------------|------|-------------------------|--------|-------------------------------------------------------------|
| Hex              | Dec  |                         |        |                                                             |
| 822H             | 2082 | IA32_X2APIC_IRR_2       | Thread | x2APIC Interrupt Request register bits [95:64] (R/O)        |
| 823H             | 2083 | IA32_X2APIC_IRR_3       | Thread | x2APIC Interrupt Request register bits [127:96] (R/O)       |
| 824H             | 2084 | IA32_X2APIC_IRR_4       | Thread | x2APIC Interrupt Request register bits [159:128] (R/O)      |
| 825H             | 2085 | IA32_X2APIC_IRR_5       | Thread | x2APIC Interrupt Request register bits [191:160] (R/O)      |
| 826H             | 2086 | IA32_X2APIC_IRR_6       | Thread | x2APIC Interrupt Request register bits [223:192] (R/O)      |
| 827H             | 2087 | IA32_X2APIC_IRR_7       | Thread | x2APIC Interrupt Request register bits [255:224] (R/O)      |
| 828H             | 2088 | IA32_X2APIC_ESR         | Thread | x2APIC Error Status register (R/W)                          |
| 82FH             | 2095 | IA32_X2APIC_LVT_CMCI    | Thread | x2APIC LVT Corrected Machine Check Interrupt register (R/W) |
| 830H             | 2096 | IA32_X2APIC_ICR         | Thread | x2APIC Interrupt Command register (R/W)                     |
| 832H             | 2098 | IA32_X2APIC_LVT_TIMER   | Thread | x2APIC LVT Timer Interrupt register (R/W)                   |
| 833H             | 2099 | IA32_X2APIC_LVT_THERMAL | Thread | x2APIC LVT Thermal Sensor Interrupt register (R/W)          |
| 834H             | 2100 | IA32_X2APIC_LVT_PMI     | Thread | x2APIC LVT Performance Monitor register (R/W)               |
| 835H             | 2101 | IA32_X2APIC_LVT_LINT0   | Thread | x2APIC LVT LINT0 register (R/W)                             |
| 836H             | 2102 | IA32_X2APIC_LVT_LINT1   | Thread | x2APIC LVT LINT1 register (R/W)                             |
| 837H             | 2103 | IA32_X2APIC_LVT_ERROR   | Thread | x2APIC LVT Error register (R/W)                             |
| 838H             | 2104 | IA32_X2APIC_INIT_COUNT  | Thread | x2APIC Initial Count register (R/W)                         |
| 839H             | 2105 | IA32_X2APIC_CUR_COUNT   | Thread | x2APIC Current Count register (R/O)                         |

## MODEL-SPECIFIC REGISTERS (MSRs)

**Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)**

| Register Address |      | Register Name         | Scope  | Bit Description                                                                                                |
|------------------|------|-----------------------|--------|----------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                       |        |                                                                                                                |
| 83EH             | 2110 | IA32_X2APIC_DIV_CONF  | Thread | x2APIC Divide Configuration register (R/W)                                                                     |
| 83FH             | 2111 | IA32_X2APIC_SEL_F_IPI | Thread | x2APIC Self IPI register (W/O)                                                                                 |
| C000_0080H       |      | IA32_EFER             | Thread | Extended Feature Enables. see Table B-2                                                                        |
| C000_0081H       |      | IA32_STAR             | Thread | System Call Target Address. (R/W). see Table B-2                                                               |
| C000_0082H       |      | IA32_LSTAR            | Thread | IA-32e Mode System Call Target Address. (R/W). see Table B-2                                                   |
| C000_0084H       |      | IA32_FMASK            | Thread | System Call Flag Mask. (R/W). see Table B-2                                                                    |
| C000_0100H       |      | IA32_FS_BASE          | Thread | Map of BASE Address of FS. (R/W). see Table B-2                                                                |
| C000_0101H       |      | IA32_GS_BASE          | Thread | Map of BASE Address of GS. (R/W). see Table B-2                                                                |
| C000_0102H       |      | IA32_KERNEL_GS_BASE   | Thread | Swap Target of BASE Address of GS. (R/W). see Table B-2                                                        |
| C000_0103H       |      | IA32_TSC_AUX          | Thread | AUXILIARY TSC Signature. (R/W). see Table B-2 and Section 16.12.2, "IA32_TSC_AUX Register and RDTSCP Support." |

### B.4.1 Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series

Intel Xeon Processor 5500 and 3400 series support additional model-specific registers listed in Table B-6. These MSRs also apply to Intel Core i7 and i5 processor family CPUID signature with DisplayFamily\_DisplayModel of 06\_1AH, 06\_1EH and 06\_1FH, see Table B-1.

Table B-6. Additional MSRs in Intel Xeon Processor 5500 and 3400 Series

| Register Address |     | Register Name                 | Scope   | Bit Description                                                                            |
|------------------|-----|-------------------------------|---------|--------------------------------------------------------------------------------------------|
| Hex              | Dec |                               |         |                                                                                            |
| 1ADH             | 429 | MSR_TURBO_RATIO_LIMIT         | Package | Actual maximum turbo frequency is multiplied by 133.33MHz. (not available to model 06_2EH) |
|                  |     | 7:0                           |         | Maximum Turbo Ratio Limit 1C. (R/O)<br>maximum Turbo mode ratio limit with 1 core active.  |
|                  |     | 15:8                          |         | Maximum Turbo Ratio Limit 2C. (R/O)<br>maximum Turbo mode ratio limit with 2cores active.  |
|                  |     | 23:16                         |         | Maximum Turbo Ratio Limit 3C. (R/O)<br>maximum Turbo mode ratio limit with 3cores active.  |
|                  |     | 31:24                         |         | Maximum Turbo Ratio Limit 4C. (R/O)<br>maximum Turbo mode ratio limit with 4 cores active. |
|                  |     | 63:32                         |         | Reserved.                                                                                  |
| 301H             | 769 | MSR_GO_SNOOP_MESF             | Package |                                                                                            |
|                  |     | 0                             |         | <b>From M to S (R/W).</b>                                                                  |
|                  |     | 1                             |         | <b>From E to S (R/W).</b>                                                                  |
|                  |     | 2                             |         | <b>From S to S (R/W).</b>                                                                  |
|                  |     | 3                             |         | <b>From F to S (R/W).</b>                                                                  |
|                  |     | 4                             |         | <b>From M to I (R/W).</b>                                                                  |
|                  |     | 5                             |         | <b>From E to I (R/W).</b>                                                                  |
|                  |     | 6                             |         | <b>From S to I (R/W).</b>                                                                  |
|                  |     | 7                             |         | <b>From F to I (R/W).</b>                                                                  |
|                  |     | 63:8                          |         | Reserved                                                                                   |
| 391H             | 913 | MSR_UNCORE_PERF_GLOBAL_CTRL   | Package | See Section 30.6.2.1, "Uncore Performance Monitoring Management Facility."                 |
| 392H             | 914 | MSR_UNCORE_PERF_GLOBAL_STATUS | Package | See Section 30.6.2.1, "Uncore Performance Monitoring Management Facility."                 |

MODEL-SPECIFIC REGISTERS (MSRs)

#### B.4.2 Additional MSRs in the Intel® Xeon® Processor 7500 Series

Intel Xeon Processor 7500 series support MSRs listed in Table B-5 (except MSR address 1ADH) and additional model-specific registers listed in Table B-7.

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series

| Register Address |     | Register Name         | Scope   | Bit Description                                          |
|------------------|-----|-----------------------|---------|----------------------------------------------------------|
| Hex              | Dec |                       |         |                                                          |
| 1ADH             | 429 | MSR_TURBO_RATIO_LIMIT | Package | <b>Reserved.</b><br>Attempt to read/write will cause #UD |
| 289H             | 649 | IA32_MC9_CTL2         | Package | see Table B-2                                            |
| 28AH             | 650 | IA32_MC10_CTL2        | Package | see Table B-2                                            |
| 28BH             | 651 | IA32_MC11_CTL2        | Package | see Table B-2                                            |
| 28CH             | 652 | IA32_MC12_CTL2        | Package | see Table B-2                                            |
| 28DH             | 653 | IA32_MC13_CTL2        | Package | see Table B-2                                            |
| 28EH             | 654 | IA32_MC14_CTL2        | Package | see Table B-2                                            |
| 28FH             | 655 | IA32_MC15_CTL2        | Package | see Table B-2                                            |
| 290H             | 656 | IA32_MC16_CTL2        | Package | see Table B-2                                            |
| 291H             | 657 | IA32_MC17_CTL2        | Package | see Table B-2                                            |
| 292H             | 658 | IA32_MC18_CTL2        | Package | see Table B-2                                            |
| 293H             | 659 | IA32_MC19_CTL2        | Package | see Table B-2                                            |
| 294H             | 660 | IA32_MC20_CTL2        | Package | see Table B-2                                            |

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)

| Register Address |      | Register Name             | Scope   | Bit Description                                               |
|------------------|------|---------------------------|---------|---------------------------------------------------------------|
| Hex              | Dec  |                           |         |                                                               |
| 295H             | 661  | IA32_MC21_CTL2            | Package | see Table B-2                                                 |
| 394H             | 816  | MSR_W_PMON_FI_XED_CTR     | Package | Uncore W-box perfmon fixed counter                            |
| 395H             | 817  | MSR_W_PMON_FI_XED_CTR_CTL | Package | Uncore U-box perfmon fixed counter control MSR                |
| 424H             | 1060 | MSR_MC9_CTL               | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 425H             | 1061 | MSR_MC9_STATUS            | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 426H             | 1062 | MSR_MC9_ADDR              | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 427H             | 1063 | MSR_MC9_MISC              | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 428H             | 1064 | MSR_MC10_CTL              | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 429H             | 1065 | MSR_MC10_STATUS           | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 42AH             | 1066 | MSR_MC10_ADDR             | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 42BH             | 1067 | MSR_MC10_MISC             | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 42CH             | 1068 | MSR_MC11_CTL              | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 42DH             | 1069 | MSR_MC11_STATUS           | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 42EH             | 1070 | MSR_MC11_ADDR             | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 42FH             | 1071 | MSR_MC11_MISC             | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 430H             | 1072 | MSR_MC12_CTL              | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 431H             | 1073 | MSR_MC12_STATUS           | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 432H             | 1074 | MSR_MC12_ADDR             | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 433H             | 1075 | MSR_MC12_MISC             | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 434H             | 1076 | MSR_MC13_CTL              | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 435H             | 1077 | MSR_MC13_STATUS           | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 436H             | 1078 | MSR_MC13_ADDR             | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 437H             | 1079 | MSR_MC13_MISC             | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 438H             | 1080 | MSR_MC14_CTL              | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)

| Register Address |      | Register Name   | Scope   | Bit Description                                               |
|------------------|------|-----------------|---------|---------------------------------------------------------------|
| Hex              | Dec  |                 |         |                                                               |
| 439H             | 1081 | MSR_MC14_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 43AH             | 1082 | MSR_MC14_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 43BH             | 1083 | MSR_MC14_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 43CH             | 1084 | MSR_MC15_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 43DH             | 1085 | MSR_MC15_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 43EH             | 1086 | MSR_MC15_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 43FH             | 1087 | MSR_MC15_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 440H             | 1088 | MSR_MC16_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 441H             | 1089 | MSR_MC16_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 442H             | 1090 | MSR_MC16_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 443H             | 1091 | MSR_MC16_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 444H             | 1092 | MSR_MC17_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 445H             | 1093 | MSR_MC17_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 446H             | 1094 | MSR_MC17_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 447H             | 1095 | MSR_MC17_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 448H             | 1096 | MSR_MC18_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 449H             | 1097 | MSR_MC18_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 44AH             | 1098 | MSR_MC18_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 44BH             | 1099 | MSR_MC18_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 44CH             | 1100 | MSR_MC19_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 44DH             | 1101 | MSR_MC19_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 44EH             | 1102 | MSR_MC19_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 44FH             | 1103 | MSR_MC19_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 450H             | 1104 | MSR_MC20_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |

MODEL-SPECIFIC REGISTERS (MSRs)

**Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)**

| Register Address |      | Register Name              | Scope   | Bit Description                                               |
|------------------|------|----------------------------|---------|---------------------------------------------------------------|
| Hex              | Dec  |                            |         |                                                               |
| 451H             | 1105 | MSR_MC20_STATUS            | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 452H             | 1106 | MSR_MC20_ADDR              | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 453H             | 1107 | MSR_MC20_MISC              | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 454H             | 1108 | MSR_MC21_CTL               | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 455H             | 1109 | MSR_MC21_STATUS            | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 456H             | 1110 | MSR_MC21_ADDR              | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 457H             | 1111 | MSR_MC21_MISC              | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| C00H             | 3072 | MSR_U_PMON_GLOBAL_CTRL     | Package | Uncore U-box perfmon global control MSR                       |
| C01H             | 3073 | MSR_U_PMON_GLOBAL_STATUS   | Package | Uncore U-box perfmon global status MSR                        |
| C02H             | 3074 | MSR_U_PMON_GLOBAL_OVF_CTRL | Package | Uncore U-box perfmon global overflow control MSR              |
| C10H             | 3088 | MSR_U_PMON_EVENT_SEL       | Package | Uncore U-box perfmon event select MSR                         |
| C11H             | 3089 | MSR_U_PMON_CTR             | Package | Uncore U-box perfmon counter MSR                              |
| C20H             | 3104 | MSR_BO_PMON_BOX_CTRL       | Package | Uncore B-box 0 perfmon local box control MSR                  |
| C21H             | 3105 | MSR_BO_PMON_BOX_STATUS     | Package | Uncore B-box 0 perfmon local box status MSR                   |
| C22H             | 3106 | MSR_BO_PMON_BOX_OVF_CTRL   | Package | Uncore B-box 0 perfmon local box overflow control MSR         |
| C30H             | 3120 | MSR_BO_PMON_EVENT_VNT_SEL0 | Package | Uncore B-box 0 perfmon event select MSR                       |
| C31H             | 3121 | MSR_BO_PMON_COUNTER_VNT    | Package | Uncore B-box 0 perfmon counter MSR                            |
| C32H             | 3122 | MSR_BO_PMON_EVENT_VNT_SEL1 | Package | Uncore B-box 0 perfmon event select MSR                       |

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description                                       |
|------------------|------|--------------------------|---------|-------------------------------------------------------|
| Hex              | Dec  |                          |         |                                                       |
| C33H             | 3123 | MSR_BO_PMON_CTR1         | Package | Uncore B-box 0 perfmon counter MSR                    |
| C34H             | 3124 | MSR_BO_PMON_EVNT_SEL2    | Package | Uncore B-box 0 perfmon event select MSR               |
| C35H             | 3125 | MSR_BO_PMON_CTR2         | Package | Uncore B-box 0 perfmon counter MSR                    |
| C36H             | 3126 | MSR_BO_PMON_EVNT_SEL3    | Package | Uncore B-box 0 perfmon event select MSR               |
| C37H             | 3127 | MSR_BO_PMON_CTR3         | Package | Uncore B-box 0 perfmon counter MSR                    |
| C40H             | 3136 | MSR_SO_PMON_BOX_CTRL     | Package | Uncore S-box 0 perfmon local box control MSR          |
| C41H             | 3137 | MSR_SO_PMON_BOX_STATUS   | Package | Uncore S-box 0 perfmon local box status MSR           |
| C42H             | 3138 | MSR_SO_PMON_BOX_OVF_CTRL | Package | Uncore S-box 0 perfmon local box overflow control MSR |
| C50H             | 3152 | MSR_SO_PMON_EVNT_SEL0    | Package | Uncore S-box 0 perfmon event select MSR               |
| C51H             | 3153 | MSR_SO_PMON_CTR0         | Package | Uncore S-box 0 perfmon counter MSR                    |
| C52H             | 3154 | MSR_SO_PMON_EVNT_SEL1    | Package | Uncore S-box 0 perfmon event select MSR               |
| C53H             | 3155 | MSR_SO_PMON_CTR1         | Package | Uncore S-box 0 perfmon counter MSR                    |
| C54H             | 3156 | MSR_SO_PMON_EVNT_SEL2    | Package | Uncore S-box 0 perfmon event select MSR               |
| C55H             | 3157 | MSR_SO_PMON_CTR2         | Package | Uncore S-box 0 perfmon counter MSR                    |
| C56H             | 3158 | MSR_SO_PMON_EVNT_SEL3    | Package | Uncore S-box 0 perfmon event select MSR               |
| C57H             | 3159 | MSR_SO_PMON_CTR3         | Package | Uncore S-box 0 perfmon counter MSR                    |

MODEL-SPECIFIC REGISTERS (MSRs)

**Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)**

| Register Address |      | Register Name              | Scope   | Bit Description                                       |
|------------------|------|----------------------------|---------|-------------------------------------------------------|
| Hex              | Dec  |                            |         |                                                       |
| C60H             | 3168 | MSR_B1_PMON_BOX_CTRL       | Package | Uncore B-box 1 perfmon local box control MSR          |
| C61H             | 3169 | MSR_B1_PMON_BOX_STATUS     | Package | Uncore B-box 1 perfmon local box status MSR           |
| C62H             | 3170 | MSR_B1_PMON_BOX_OVF_CTRL   | Package | Uncore B-box 1 perfmon local box overflow control MSR |
| C70H             | 3184 | MSR_B1_PMON_EVENT_VNT_SELO | Package | Uncore B-box 1 perfmon event select MSR               |
| C71H             | 3185 | MSR_B1_PMON_COUNTER_TRO    | Package | Uncore B-box 1 perfmon counter MSR                    |
| C72H             | 3186 | MSR_B1_PMON_EVENT_VNT_SEL1 | Package | Uncore B-box 1 perfmon event select MSR               |
| C73H             | 3187 | MSR_B1_PMON_COUNTER_TR1    | Package | Uncore B-box 1 perfmon counter MSR                    |
| C74H             | 3188 | MSR_B1_PMON_EVENT_VNT_SEL2 | Package | Uncore B-box 1 perfmon event select MSR               |
| C75H             | 3189 | MSR_B1_PMON_COUNTER_TR2    | Package | Uncore B-box 1 perfmon counter MSR                    |
| C76H             | 3190 | MSR_B1_PMON_EVENT_VNT_SEL3 | Package | Uncore B-box 1vperfmon event select MSR               |
| C77H             | 3191 | MSR_B1_PMON_COUNTER_TR3    | Package | Uncore B-box 1 perfmon counter MSR                    |
| C80H             | 3120 | MSR_W_PMON_BOX_CTRL        | Package | Uncore W-box perfmon local box control MSR            |
| C81H             | 3121 | MSR_W_PMON_BOX_STATUS      | Package | Uncore W-box perfmon local box status MSR             |
| C82H             | 3122 | MSR_W_PMON_BOX_OVF_CTRL    | Package | Uncore W-box perfmon local box overflow control MSR   |
| C90H             | 3136 | MSR_W_PMON_EVENT_VNT_SELO  | Package | Uncore W-box perfmon event select MSR                 |
| C91H             | 3137 | MSR_W_PMON_COUNTER_TRO     | Package | Uncore W-box perfmon counter MSR                      |

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description                                       |
|------------------|------|--------------------------|---------|-------------------------------------------------------|
| Hex              | Dec  |                          |         |                                                       |
| C92H             | 3138 | MSR_W_PMON_EV_NT_SEL1    | Package | Uncore W-box perfmon event select MSR                 |
| C93H             | 3139 | MSR_W_PMON_CTR1          | Package | Uncore W-box perfmon counter MSR                      |
| C94H             | 3140 | MSR_W_PMON_EV_NT_SEL2    | Package | Uncore W-box perfmon event select MSR                 |
| C95H             | 3141 | MSR_W_PMON_CTR2          | Package | Uncore W-box perfmon counter MSR                      |
| C96H             | 3142 | MSR_W_PMON_EV_NT_SEL3    | Package | Uncore W-box perfmon event select MSR                 |
| C97H             | 3143 | MSR_W_PMON_CTR3          | Package | Uncore W-box perfmon counter MSR                      |
| CA0H             | 3232 | MSR_MO_PMON_BOX_CTRL     | Package | Uncore M-box 0 perfmon local box control MSR          |
| CA1H             | 3233 | MSR_MO_PMON_BOX_STATUS   | Package | Uncore M-box 0 perfmon local box status MSR           |
| CA2H             | 3234 | MSR_MO_PMON_BOX_OVF_CTRL | Package | Uncore M-box 0 perfmon local box overflow control MSR |
| CA4H             | 3236 | MSR_MO_PMON_TIMESTAMP    | Package | Uncore M-box 0 perfmon time stamp unit select MSR     |
| CA5H             | 3237 | MSR_MO_PMON_DSP          | Package | Uncore M-box 0 perfmon DSP unit select MSR            |
| CA6H             | 3238 | MSR_MO_PMON_ISS          | Package | Uncore M-box 0 perfmon ISS unit select MSR            |
| CA7H             | 3239 | MSR_MO_PMON_MAP          | Package | Uncore M-box 0 perfmon MAP unit select MSR            |
| CA8H             | 3240 | MSR_MO_PMON_MSC_THR      | Package | Uncore M-box 0 perfmon MIC THR select MSR             |
| CA9H             | 3241 | MSR_MO_PMON_PGT          | Package | Uncore M-box 0 perfmon PGT unit select MSR            |
| CAAH             | 3242 | MSR_MO_PMON_PLD          | Package | Uncore M-box 0 perfmon PLD unit select MSR            |

MODEL-SPECIFIC REGISTERS (MSRs)

**Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)**

| Register Address |      | Register Name            | Scope   | Bit Description                                       |
|------------------|------|--------------------------|---------|-------------------------------------------------------|

## B.5 MSRS IN THE INTEL XEON PROCESSOR 5600 SERIES (INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel Xeon processor 5600 series (Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table B-5, Table B-6, plus additional MSR listed in Table B-8. These MSRs also apply to Intel Core i7, i5 and i3 processor family with CPUID signature DisplayFamily\_DisplayModel of 06\_25H and 06\_2CH, see Table B-1.

Table B-8. Additional MSRs Supported by Intel Processors (Intel Microarchitecture Code Name Westmere)

| Register Address |     | Register Name             | Scope   | Bit Description                                                                                                  |

## B.7 MSRS IN INTEL® PROCESSOR FAMILY (INTEL® MICROARCHITECTURE CODE NAME SANDY BRIDGE)

Table B-10 lists model-specific registers (MSRs) that are common to Intel® processor family based on Intel® microarchitecture (Sandy Bridge). All architectural MSRs listed in Table B-2 are supported. These processors have a CPUID signature with

DisplayFamily\_DisplayModel of 06\_2AH, 06\_2DH, see Table B-1. Additional MSRs specific to 06\_2AH are listed in Table B-11.

**Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge**

| Register Address |     | Register Name            | Scope   | Bit Description                                                                |
|------------------|-----|--------------------------|---------|--------------------------------------------------------------------------------|
| Hex              | Dec |                          |         |                                                                                |

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture  
Code Name Sandy Bridge (Contd.)

| Register Address |      | Register Name               | Scope  | Bit Description                                                                                                                     |
|------------------|------|-----------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                             |        |                                                                                                                                     |
| 40AH             | 1034 | IA32_MC2_ADDR               | Core   | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                                                                                         |
| 40BH             | 1035 | IA32_MC2_MISC               | Core   | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                                                                                         |
| 40CH             | 1036 | IA32_MC3_CTL                | Core   | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                          |
| 40DH             | 1037 | IA32_MC3_STATUS             | Core   | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs." and Appendix E.                                                                       |
| 40EH             | 1038 | IA32_MC3_ADDR               | Core   | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                                                                                         |
| 40FH             | 1039 | IA32_MC3_MISC               | Core   | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                                                                                         |
| 410H             | 1040 | MSR_MC4_CTL                 | Core   | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                          |
|                  |      | 0                           |        | PCU Hardware Error. (R/W)<br>When set, enables signaling of PCU hardware detected errors.                                           |
|                  |      | 1                           |        | PCU Controller Error. (R/W)<br>When set, enables signaling of PCU controller detected errors                                        |
|                  |      | 2                           |        | PCU Firmware Error. (R/W)<br>When set, enables signaling of PCU firmware detected errors                                            |
|                  |      | 63:2                        |        | Reserved.                                                                                                                           |
| 411H             | 1041 | IA32_MC4_STATUS             | Core   | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs." and Appendix E.                                                                       |
| 480H             | 1152 | IA32_VMX_BASIC              | Thread | Reporting Register of Basic VMX Capabilities. (R/O) see Table B-2.<br>See Appendix G.1, "Basic VMX Information"                     |
| 481H             | 1153 | IA32_VMX_PINBA<br>SED_CTLs  | Thread | Capability Reporting Register of Pin-based VM-execution Controls. (R/O) see Table B-2.<br>See Appendix G.3, "VM-Execution Controls" |
| 482H             | 1154 | IA32_VMX_PROCB<br>ASED_CTLs | Thread | Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls"  |

**Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture  
Code Name Sandy Bridge (Contd.)**

| Register Address |      | Register Name            | Scope  | Bit Description                                                                                                                      |
|------------------|------|--------------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                          |        |                                                                                                                                      |
| 483H             | 1155 | IA32_VMX_EXIT_CTLs       | Thread | Capability Reporting Register of VM-exit Controls. (R/O) see Table B-2.<br>See Appendix G.4, "VM-Exit Controls"                      |
| 484H             | 1156 | IA32_VMX_ENTRY_CTLs      | Thread | Capability Reporting Register of VM-entry Controls. (R/O) see Table B-2.<br>See Appendix G.5, "VM-Entry Controls"                    |
| 485H             | 1157 | IA32_VMX_MISC            | Thread | Reporting Register of Miscellaneous VMX Capabilities. (R/O) see Table B-2.<br>See Appendix G.6, "Miscellaneous Data"                 |
| 486H             | 1158 | IA32_VMX_CRO_FIXED0      | Thread | Capability Reporting Register of CRO Bits Fixed to 0. (R/O) see Table B-2.<br>See Appendix G.7, "VMX-Fixed Bits in CRO"              |
| 487H             | 1159 | IA32_VMX_CRO_FIXED1      | Thread | Capability Reporting Register of CRO Bits Fixed to 1. (R/O) see Table B-2.<br>See Appendix G.7, "VMX-Fixed Bits in CRO"              |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0      | Thread | Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"              |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1      | Thread | Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) see Table B-2.<br>See Appendix G.8, "VMX-Fixed Bits in CR4"              |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM       | Thread | Capability Reporting Register of VMCS Field Enumeration. (R/O). see Table B-2.<br>See Appendix G.9, "VMCS Enumeration"               |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTLs2 | Thread | Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls" |
| 4C1H             | 1217 | IA32_A_PMCO              | Thread | see Table B-2                                                                                                                        |
| 4C2H             | 1218 | IA32_A_PMC1              | Thread | see Table B-2                                                                                                                        |
| 4C3H             | 1219 | IA32_A_PMC2              | Thread | see Table B-2                                                                                                                        |
| 4C4H             | 1220 | IA32_A_PMC3              | Thread | see Table B-2                                                                                                                        |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture  
Code Name Sandy Bridge (Contd.)

| Register Address |      | Register Name        | Scope   | Bit Description                                                                                                                                                                                                                                               |
|------------------|------|----------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                      |         |                                                                                                                                                                                                                                                               |
| 4C5H             | 1221 | IA32_A_PMC4          | Core    | see Table B-2                                                                                                                                                                                                                                                 |
| 4C6H             | 1222 | IA32_A_PMC5          | Core    | see Table B-2                                                                                                                                                                                                                                                 |
| 4C7H             | 1223 | IA32_A_PMC6          | Core    | see Table B-2                                                                                                                                                                                                                                                 |
| C8H              | 200  | IA32_A_PMC7          | Core    | see Table B-2                                                                                                                                                                                                                                                 |
| 600H             | 1536 | IA32_DS_AREA         | Thread  | DS Save Area. (R/W). see Table B-2<br>See Section 30.9.4, "Debug Store (DS) Mechanism."                                                                                                                                                                       |
| 606H             | 1542 | MSR_RAPL_POWE_R_UNIT | Package | <b>Unit Multipliers used in RAPL Interfaces</b> (R/O)<br>See Section 14.7.1, "RAPL Interfaces."                                                                                                                                                               |
| 60AH             | 1546 | MSR_PKGC3_IRTL       | Package | <b>Package C3 Interrupt Response Limit</b> (R/W)<br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.                                                                         |
|                  |      | 9:0                  |         | Interrupt response time limit. (R/W)<br>Specifies the limit that should be used to decide if the package should be put into a package C3 state.                                                                                                               |
|                  |      | 12:10                |         | Time Unit. (R/W)<br>Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported:<br>000b: 1 ns<br>001b: 32 ns<br>010b: 1024 ns<br>011b: 32768 ns<br>100b: 1048576 ns<br>101b: 33554432 ns |
|                  |      | 14:13                |         | Reserved.                                                                                                                                                                                                                                                     |
|                  |      | 15                   |         | Valid. (R/W)<br>Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.                                                                                                                          |

| 721H             | 1824 | MSR_UNC_CBO_2_PERFEVTSEL1 | Package | Uncore C-Box 2, counter 1 event select MSR |
| 725H             | 1829 | MSR_UNC_CBO_2_UNIT_STATUS | Package | Uncore C-Box 2, Overflow Status            |
| 726H             | 1830 | MSR_UNC_CBO_2_PER_CTR0    | Package | Uncore C-Box 2, performance counter 0      |
| 727H             | 1831 | MSR_UNC_CBO_2_PER_CTR1    | Package | Uncore C-Box 2, performance counter 1      |
| 730H             | 1840 | MSR_UNC_CBO_3_PERFEVTSEL0 | Package | Uncore C-Box 3, counter 0 event select MSR |
| 731H             | 1841 | MSR_UNC_CBO_3_PERFEVTSEL1 | Package | Uncore C-Box 3, counter 1 event select MSR |
| 725H             | 1845 | MSR_UNC_CBO_3_UNIT_STATUS | Package | Uncore C-Box 3, Overflow Status            |

## MODEL-SPECIFIC REGISTERS (MSRs)

**Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge (Contd.)**

| Register Address |      | Register Name          | Scope   | Bit Description                                                                                                |
|------------------|------|------------------------|---------|----------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                        |         |                                                                                                                |
| 736H             | 1846 | MSR_UNC_CBO_3_PER_CTR0 | Package | Uncore C-Box 3, performance counter 0                                                                          |
| 737H             | 1847 | MSR_UNC_CBO_3_PER_CTR1 | Package | Uncore C-Box 3, performance counter 1                                                                          |
| C000_0080H       |      | IA32_EFER              | Thread  | Extended Feature Enables. see Table B-2                                                                        |
| C000_0081H       |      | IA32_STAR              | Thread  | System Call Target Address. (R/W). see Table B-2                                                               |
| C000_0082H       |      | IA32_LSTAR             | Thread  | IA-32e Mode System Call Target Address. (R/W). see Table B-2                                                   |
| C000_0084H       |      | IA32_FMASK             | Thread  | System Call Flag Mask. (R/W). see Table B-2                                                                    |
| C000_0100H       |      | IA32_FS_BASE           | Thread  | Map of BASE Address of FS. (R/W). see Table B-2                                                                |
| C000_0101H       |      | IA32_GS_BASE           | Thread  | Map of BASE Address of GS. (R/W). see Table B-2                                                                |
| C000_0102H       |      | IA32_KERNEL_GS_BASE    | Thread  | Swap Target of BASE Address of GS. (R/W). see Table B-2                                                        |
| C000_0103H       |      | IA32_TSC_AUX           | Thread  | AUXILIARY TSC Signature. (R/W). see Table B-2 and Section 16.12.2, "IA32_TSC_AUX Register and RDTSCP Support." |

### B.7.1 MSRs In Second Generation Intel® Core Processor Family (Intel® Microarchitecture Code Name Sandy Bridge)

Table B-11 lists model-specific registers (MSRs) that are specific to second generation for Intel® Core processor family (Intel® microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2AH, see Table B-1.

Table B-11. MSRs Supported by Second Generation Intel Core Processors (Intel Microarchitecture Code Name Sandy Bridge)

| Register Address |      | Register Name         | Scope   | Bit Description                                                                                                    |
|------------------|------|-----------------------|---------|--------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                       |         |                                                                                                                    |
| 1ADH             | 429  | MSR_TURBO_RATIO_LIMIT | Package | <b>Maximum Ratio Limit of Turbo Mode.</b><br>RO if MSR_PLATFORM_INFO.[28] = 0,<br>RW if MSR_PLATFORM_INFO.[28] = 1 |
|                  |      | 7:0                   | Package | <b>Maximum Ratio Limit for 1C.</b><br>Maximum turbo ratio limit of 1 core active.                                  |
|                  |      | 15:8                  | Package | <b>Maximum Ratio Limit for 2C.</b><br>Maximum turbo ratio limit of 2 core active.                                  |
|                  |      | 23:16                 | Package | <b>Maximum Ratio Limit for 3C.</b><br>Maximum turbo ratio limit of 3 core active.                                  |
|                  |      | 31:24                 | Package | <b>Maximum Ratio Limit for 4C.</b><br>Maximum turbo ratio limit of 4 core active.                                  |

## B.7.2 MSRs In Next Generation Intel® Xeon Processor Family (Intel® Microarchitecture Code Name Sandy Bridge)

Table B-12 lists selected model-specific registers (MSRs) that are specific to the next generation Intel® Xeon processor family (Intel® microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2DH, see Table B-1.

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-12. Selected MSRs Supported by Next Generation Intel Xeon Processors  
(Intel Microarchitecture Code Name Sandy Bridge)

| Register Address |      | Register Name  | Scope   | Bit Description                                               |
|------------------|------|----------------|---------|---------------------------------------------------------------|
| Hex              | Dec  |                |         |                                                               |
| 285H             | 645  | IA32_MC5_CTL2  | Package | see Table B-2                                                 |
| 286H             | 646  | IA32_MC6_CTL2  | Package | see Table B-2                                                 |
| 287H             | 647  | IA32_MC7_CTL2  | Package | see Table B-2                                                 |
| 288H             | 648  | IA32_MC8_CTL2  | Package | see Table B-2                                                 |
| 289H             | 649  | IA32_MC9_CTL2  | Package | see Table B-2                                                 |
| 28AH             | 650  | IA32_MC10_CTL2 | Package | see Table B-2                                                 |
| 28BH             | 651  | IA32_MC11_CTL2 | Package | see Table B-2                                                 |
| 28CH             | 652  | IA32_MC12_CTL2 | Package | see Table B-2                                                 |
| 28DH             | 653  | IA32_MC13_CTL2 | Package | see Table B-2                                                 |
| 28EH             | 654  | IA32_MC14_CTL2 | Package | see Table B-2                                                 |
| 28FH             | 655  | IA32_MC15_CTL2 | Package | see Table B-2                                                 |
| 290H             | 656  | IA32_MC16_CTL2 | Package | see Table B-2                                                 |
| 291H             | 657  | IA32_MC17_CTL2 | Package | see Table B-2                                                 |
| 292H             | 658  | IA32_MC18_CTL2 | Package | see Table B-2                                                 |
| 293H             | 659  | IA32_MC19_CTL2 | Package | see Table B-2                                                 |
| 414H             | 1044 | MSR_MC5_CTL    | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 415H             | 1045 | MSR_MC5_STATUS | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs." and Appendix E. |
| 416H             | 1046 | MSR_MC5_ADDR   | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 417H             | 1047 | MSR_MC5_MISC   | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 418H             | 1048 | MSR_MC6_CTL    | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 419H             | 1049 | MSR_MC6_STATUS | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs." and Appendix E. |
| 41AH             | 1050 | MSR_MC6_ADDR   | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 41BH             | 1051 | MSR_MC6_MISC   | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 41CH             | 1052 | MSR_MC7_CTL    | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 41DH             | 1053 | MSR_MC7_STATUS | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs." and Appendix E. |

**Table B-12. Selected MSRs Supported by Next Generation Intel Xeon Processors  
(Intel Microarchitecture Code Name Sandy Bridge) (Contd.)**

| Register Address |      | Register Name   | Scope   | Bit Description                                               |
|------------------|------|-----------------|---------|---------------------------------------------------------------|
| Hex              | Dec  |                 |         |                                                               |
| 41EH             | 1054 | MSR_MC7_ADDR    | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 41FH             | 1055 | MSR_MC7_MISC    | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 420H             | 1056 | MSR_MC8_CTL     | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 421H             | 1057 | MSR_MC8_STATUS  | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E. |
| 422H             | 1058 | MSR_MC8_ADDR    | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 423H             | 1059 | MSR_MC8_MISC    | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 424H             | 1060 | MSR_MC9_CTL     | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 425H             | 1061 | MSR_MC9_STATUS  | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E. |
| 426H             | 1062 | MSR_MC9_ADDR    | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 427H             | 1063 | MSR_MC9_MISC    | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 428H             | 1064 | MSR_MC10_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 429H             | 1065 | MSR_MC10_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E. |
| 42AH             | 1066 | MSR_MC10_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 42BH             | 1067 | MSR_MC10_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 42CH             | 1068 | MSR_MC11_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 42DH             | 1069 | MSR_MC11_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E. |
| 42EH             | 1070 | MSR_MC11_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 42FH             | 1071 | MSR_MC11_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 430H             | 1072 | MSR_MC12_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 431H             | 1073 | MSR_MC12_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E. |
| 432H             | 1074 | MSR_MC12_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 433H             | 1075 | MSR_MC12_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 434H             | 1076 | MSR_MC13_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 435H             | 1077 | MSR_MC13_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E. |

MODEL-SPECIFIC REGISTERS (MSRs)

**Table B-12. Selected MSRs Supported by Next Generation Intel Xeon Processors  
(Intel Microarchitecture Code Name Sandy Bridge) (Contd.)**

| Register Address |      | Register Name   | Scope   | Bit Description                                               |
|------------------|------|-----------------|---------|---------------------------------------------------------------|
| Hex              | Dec  |                 |         |                                                               |
| 436H             | 1078 | MSR_MC13_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 437H             | 1079 | MSR_MC13_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 438H             | 1080 | MSR_MC14_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 439H             | 1081 | MSR_MC14_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 43AH             | 1082 | MSR_MC14_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 43BH             | 1083 | MSR_MC14_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 43CH             | 1084 | MSR_MC15_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 43DH             | 1085 | MSR_MC15_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 43EH             | 1086 | MSR_MC15_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 43FH             | 1087 | MSR_MC15_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 440H             | 1088 | MSR_MC16_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 441H             | 1089 | MSR_MC16_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 442H             | 1090 | MSR_MC16_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 443H             | 1091 | MSR_MC16_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 444H             | 1092 | MSR_MC17_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 445H             | 1093 | MSR_MC17_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 446H             | 1094 | MSR_MC17_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 447H             | 1095 | MSR_MC17_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 448H             | 1096 | MSR_MC18_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 449H             | 1097 | MSR_MC18_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |
| 44AH             | 1098 | MSR_MC18_ADDR   | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."                   |
| 44BH             | 1099 | MSR_MC18_MISC   | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."                   |
| 44CH             | 1100 | MSR_MC19_CTL    | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                    |
| 44DH             | 1101 | MSR_MC19_STATUS | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E. |

## B.8 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table B-13 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table B-1.

- MSRs with an "IA32\_" prefix are designated as "architectural." This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an "MSR\_" prefix are model specific with respect to address functionalities. The column "Model Availability" lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See "CPUID—CPU Identification" in Chapter 3 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*.

**Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors**

| Register Address |     | Register Name<br>Fields and Flags | Model Availability  | Shared/<br>Unique <sup>1</sup> | Bit Description                                  |
|------------------|-----|-----------------------------------|---------------------|--------------------------------|--------------------------------------------------|
| Hex              | Dec |                                   |                     |                                |                                                  |
| 0H               | 0   | IA32_P5_MC_ADDR                   | 0, 1, 2,<br>3, 4, 6 | Shared                         | See Appendix B.12, "MSRs in Pentium Processors." |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

| Register Address |     | Register Name Fields and Flags | Model Availability | Shared/Unique <sup>7</sup> | Bit Description                                                                                                                                                                                                                                                 |
|------------------|-----|--------------------------------|--------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                                |                    |                            |                                                                                                                                                                                                                                                                 |
| 1H               | 1   | IA32_P5_MC_TYPE                | 0, 1, 2, 3, 4, 6   | Shared                     | See Appendix B.12, "MSRs in Pentium Processors."                                                                                                                                                                                                                |
| 6H               | 6   | IA32_MONITOR_FILTER_LINE_SIZE  | 3, 4, 6            | Shared                     | See Section 8.10.5, "Monitor/Mwait Address Range Determination."                                                                                                                                                                                                |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER        | 0, 1, 2, 3, 4, 6   | Unique                     | Time Stamp Counter.<br>see Table B-2                                                                                                                                                                                                                            |
|                  |     |                                |                    |                            | On earlier processors, only the lower 32 bits are writable. On any write to the lower 32 bits, the upper 32 bits are cleared. For processor family 0FH, models 3 and 4: all 64 bits are writable.                                                               |
| 17H              | 23  | IA32_PLATFORM_ID               | 0, 1, 2, 3, 4, 6   | Shared                     | Platform ID. (R). see Table B-2<br>The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.                                                                                             |
| 1BH              | 27  | IA32_APIC_BASE                 | 0, 1, 2, 3, 4, 6   | Unique                     | APIC Location and Status. (R/W)<br>see Table B-2. See Section 10.4.4, "Local APIC Status and Location."                                                                                                                                                         |
| 2AH              | 42  | MSR_EBC_HARD_POWERON           | 0, 1, 2, 3, 4, 6   | Shared                     | Processor Hard Power-On Configuration.<br>(R/W) Enables and disables processor features; (R) indicates current processor configuration.                                                                                                                         |
|                  |     | 0                              |                    |                            | Output Tri-state Enabled. (R)<br>Indicates whether tri-state output is enabled (1) or disabled (0) as set by the strapping of SMI#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted. |

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

| Register Address |     | Register Name<br>Fields and Flags | Model<br>Avail-<br>ability | Shared/<br>Unique <sup>7</sup> | Bit Description                                                                                                                                                                                                                                                                 |
|------------------|-----|-----------------------------------|----------------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                                   |                            |                                |                                                                                                                                                                                                                                                                                 |
|                  |     | 1                                 |                            |                                | Execute BIST. (R)<br>Indicates whether the execution of the BIST is enabled (1) or disabled (0) as set by the strapping of INIT#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.                   |
|                  |     | 2                                 |                            |                                | In Order Queue Depth. (R)<br>Indicates whether the in order queue depth for the system bus is 1 (1) or up to 12 (0) as set by the strapping of A7#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted. |
|                  |     | 3                                 |                            |                                | MCERR# Observation Disabled. (R)<br>Indicates whether MCERR# observation is enabled (0) or disabled (1) as determined by the strapping of A9#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.      |
|                  |     | 4                                 |                            |                                | BINIT# Observation Enabled. (R)<br>Indicates whether BINIT# observation is enabled (0) or disabled (1) as determined by the strapping of A10#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.      |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

| Register Address |     | Register Name Fields and Flags | Model Availability  | Shared/Unique <sup>7</sup> | Bit Description                                                                                                                                                                                                                                                  |
|------------------|-----|--------------------------------|---------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                                |                     |                            |                                                                                                                                                                                                                                                                  |
|                  |     | 6:5                            |                     |                            | APIC Cluster ID. (R)<br>Contains the logical APIC cluster ID value as set by the strapping of A12# and A11#. The logical cluster ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted. |
|                  |     | 7                              |                     |                            | Bus Park Disable. (R)<br>Indicates whether bus park is enabled (0) or disabled (1) as set by the strapping of A15#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.                  |
|                  |     | 11:8                           |                     |                            | Reserved.                                                                                                                                                                                                                                                        |
|                  |     | 13:12                          |                     |                            | Agent ID. (R)<br>Contains the logical agent ID value as set by the strapping of BR[3:0]. The logical ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.                             |
|                  |     | 63:14                          |                     |                            | Reserved.                                                                                                                                                                                                                                                        |
| 2BH              | 43  | MSR_EBC_SOFT_POWERON           | 0, 1, 2,<br>3, 4, 6 | Shared                     | Processor Soft Power-On Configuration. (R/W)<br>Enables and disables processor features.                                                                                                                                                                         |
|                  |     | 0                              |                     |                            | RCNT/SCNT On Request Encoding Enable. (R/W)<br>Controls the driving of RCNT/SCNT on the request encoding. Set to enable (1); clear to disabled (0, default).                                                                                                     |

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

See Section 14.5.2, "Thermal Monitor," and see Table B-2.                                                                                                                                                                                                                                                             |
|                  |     | 4                                 |                     |                                | Split-Lock Disable. When set, the bit causes an #AC exception to be issued instead of a split-lock cycle. Operating systems that set this bit must align system structures to avoid split-lock scenarios. When the bit is clear (default), normal split-locks are issued to the bus. This debug feature is specific to the Pentium 4 processor. |
|                  |     | 5                                 |                     |                                | Reserved.                                                                                                                                                                                                                                                                                                                                       |

(R/W)</p> <p>When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 11.5.6, "L1 Data Cache Context Mode."</p> <p>When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive.</p> <p>If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24].</p> |

| 482H             | 1154 | IA32_VMX_PROCBASED_CTLs           | 3, 4, 6            | Unique                         | Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls" and see Table B-2. |
| 483H             | 1155 | IA32_VMX_EXIT_CTLs                | 3, 4, 6            | Unique                         | Capability Reporting Register of VM-exit Controls. (R/O) See Appendix G.4, "VM-Exit Controls" and see Table B-2.                                   |
| 484H             | 1156 | IA32_VMX_ENTRY_CTLs               | 3, 4, 6            | Unique                         | Capability Reporting Register of VM-entry Controls. (R/O) See Appendix G.5, "VM-Entry Controls" and see Table B-2.                                 |
| 485H             | 1157 | IA32_VMX_MISC                     | 3, 4, 6            | Unique                         | Reporting Register of Miscellaneous VMX Capabilities. (R/O) See Appendix G.6, "Miscellaneous Data" and see Table B-2.                              |
| 486H             | 1158 | IA32_VMX_CRO_FIXED0               | 3, 4, 6            | Unique                         | Capability Reporting Register of CRO Bits Fixed to 0. (R/O) See Appendix G.7, "VMX-Fixed Bits in CRO" and see Table B-2.                           |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

| Register Address |      | Register Name<br>Fields and Flags | Model<br>Avail-<br>ability | Shared/<br>Unique <sup>7</sup> | Bit Description                                                                                                                                                                                                                                                                          |
|------------------|------|-----------------------------------|----------------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                                   |                            |                                |                                                                                                                                                                                                                                                                                          |
| 487H             | 1159 | IA32_VMX_CRO_FIXED1               | 3, 4, 6                    | Unique                         | Capability Reporting Register of CRO Bits Fixed to 1. (R/O)<br>See Appendix G.7, "VMX-Fixed Bits in CRO" and see Table B-2.                                                                                                                                                              |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0               | 3, 4, 6                    | Unique                         | Capability Reporting Register of CR4 Bits Fixed to 0. (R/O)<br>See Appendix G.8, "VMX-Fixed Bits in CR4" and see Table B-2.                                                                                                                                                              |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1               | 3, 4, 6                    | Unique                         | Capability Reporting Register of CR4 Bits Fixed to 1. (R/O)<br>See Appendix G.8, "VMX-Fixed Bits in CR4" and see Table B-2.                                                                                                                                                              |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM                | 3, 4, 6                    | Unique                         | Capability Reporting Register of VMCS Field Enumeration. (R/O).<br>See Appendix G.9, "VMCS Enumeration" and see Table B-2.                                                                                                                                                               |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTL2           | 3, 4, 6                    | Unique                         | Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls" and see Table B-2.                                                                                                                                  |
| 600H             | 1536 | IA32_DS_AREA                      | 0, 1, 2,<br>3, 4, 6        | Unique                         | DS Save Area. (R/W). see Table B-2.<br>See Section 30.9.4, "Debug Store (DS) Mechanism."                                                                                                                                                                                                 |
| 680H             | 1664 | MSR_LASTBRANCH_0_FROM_LIP         | 3, 4, 6                    | Unique                         | Last Branch Record 0. (R/W)<br>One of 16 pairs of last branch record registers on the last branch record stack (680H-68FH). This part of the stack contains pointers to the <b>source instruction</b> for one of the last 16 branches, exceptions, or interrupts taken by the processor. |

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

| Register Address |      | Register Name<br>Fields and Flags | Model Availability | Shared/<br>Unique <sup>7</sup> | Bit Description                                                                                                                                                                                                      |
|------------------|------|-----------------------------------|--------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                                   |                    |                                |                                                                                                                                                                                                                      |
|                  |      |                                   |                    |                                | The MSRs at 680H-68FH, 6COH-6CfH are not available in processor releases before family OFH, model 03H. These MSRs replace MSRs previously located at 1DBH-1DEH which performed the same function for early releases. |
|                  |      |                                   |                    |                                | See Section 16.8, "Last Branch, Interrupt, and Exception Recording (Processors based on Intel NetBurst® Microarchitecture)."                                                                                         |

## NOTES

1. For HT-enabled processors, there may be more than one logical processors per physical unit. If an MSR is Shared, this means that one MSR is shared between logical processors. If an MSR is unique, this means that each logical processor has its own MSR.

### B.8.1 MSRs Unique to Intel Xeon Processor MP with L3 Cache

The MSRs listed in Table B-14 apply to Intel Xeon Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (See CPUID instruction for more details.).

Table B-14. MSRs Unique to 64-bit Intel Xeon Processor MP with Up to an 8 MB L3 Cache

| Register Address |  | Register Name<br>Fields and Flags | Model Availability | Shared/<br>Unique | Bit Description                                                                                                                                                   |
|------------------|--|-----------------------------------|--------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 107CCH           |  | MSR_IFSB_BUSQ0                    | 3, 4               | Shared            | IFSB BUSQ Event Control and Counter Register. (R/W)<br>See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache." |
| 107CDH           |  | MSR_IFSB_BUSQ1                    | 3, 4               | Shared            | IFSB BUSQ Event Control and Counter Register. (R/W)                                                                                                               |
| 107CEH           |  | MSR_IFSB_SNPO0                    | 3, 4               | Shared            | IFSB SNPQ Event Control and Counter Register. (R/W)<br>See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache." |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-14. MSRs Unique to 64-bit Intel Xeon Processor MP with Up to an 8 MB L3 Cache (Contd.)

| Register Address |  | Register Name<br>Fields and Flags | Model<br>Avail-<br>ability | Shared/<br>Unique | Bit Description                                                                                                                                                               |
|------------------|--|-----------------------------------|----------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 107CFH           |  | MSR_IFSB_SNPQ1                    | 3, 4                       | Shared            | IFSB SNPQ Event Control and Counter Register. (R/W)                                                                                                                           |
| 107DOH           |  | MSR_EFSB_DRDY0                    | 3, 4                       | Shared            | IFSB DRDY Event Control and Counter Register. (R/W)<br>See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache" for details. |
| 107D1H           |  | MSR_EFSB_DRDY1                    | 3, 4                       | Shared            | IFSB DRDY Event Control and Counter Register. (R/W)                                                                                                                           |
| 107D2H           |  | MSR_IFSB_CTL6                     | 3, 4                       | Shared            | IFSB Latency Event Control Register. (R/W)<br>See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache" for details.          |
| 107D3H           |  | MSR_IFSB_CTR7                     | 3, 4                       | Shared            | IFSB Latency Event Counter Register. (R/W)<br>See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."                      |

The MSRs listed in Table B-15 apply to Intel Xeon Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding OFH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table B-15 are shared between logical processors in the same core, but are replicated for each core.

Table B-15. MSRs Unique to Intel Xeon Processor 7100 Series

| Register Address | Register Name<br>Fields and Flags | Model<br>Avail-<br>ability | Shared/<br>Unique | Bit Description                                                                                                                                                         |

| 107D3H           | MSR_EMON_L3_CTR_C<br>TL7          | 6                          | Shared            | FSB Event Control and Counter Register. (R/W)                                                                                                                           |

## B.9 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table B-16. The column "Shared/Unique" applies to Intel Core Duo processor. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

**Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV**

| Register Address |     | Register Name            | Shared/Unique | Bit Description                                                                                                                                                    |
|------------------|-----|--------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                          |               |                                                                                                                                                                    |
| 0H               | 0   | P5_MC_ADDR               | Unique        | See Appendix B.12, "MSRs in Pentium Processors." and see Table B-2                                                                                                 |
| 1H               | 1   | P5_MC_TYPE               | Unique        | See Appendix B.12, "MSRs in Pentium Processors." and see Table B-2                                                                                                 |
| 6H               | 6   | IA32_MONITOR_FILTER_SIZE | Unique        | See Section 8.10.5, "Monitor/Mwait Address Range Determination." and see Table B-2                                                                                 |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER  | Unique        | See Section 16.12, "Time-Stamp Counter." and see Table B-2                                                                                                         |
| 17H              | 23  | IA32_PLATFORM_ID         | Shared        | Platform ID. (R) see Table B-2<br>The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load. |
| 1BH              | 27  | IA32_APIC_BASE           | Unique        | See Section 10.4.4, "Local APIC Status and Location." and see Table B-2                                                                                            |
| 2AH              | 42  | MSR_EBL_CR_POWERON       | Shared        | Processor Hard Power-On Configuration. (R/W)<br>Enables and disables processor features; (R) indicates current processor configuration.                            |
|                  |     | 0                        |               | Reserved.                                                                                                                                                          |
|                  |     | 1                        |               | Data Error Checking Enable. (R/W)<br>1 = Enabled; 0 = Disabled<br>Note: Not all processor implements R/W.                                                          |
|                  |     | 2                        |               | Response Error Checking Enable. (R/W)<br>1 = Enabled; 0 = Disabled<br>Note: Not all processor implements R/W.                                                      |

|                  |     | 0                 |                | RIPV.<br>When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted          |
|                  |     | 1                 |                | EIPV.<br>When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.                                                                        |
|                  |     | 2                 |                | MCIP.<br>When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception. |

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

| Register Address |     | Register Name         | Shared/<br>Unique | Bit Description                                                                                                                                                                                                                                                                                                                                  |

| 2FFH             | 767  | IA32_MTRR_DEF_TYPE | Unique         | Default Memory Types. (R/W). see Table B-2.<br>See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR." |
| 400H             | 1024 | IA32_MCO_CTL       | Unique         | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                      |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

| Register Address |      | Register Name   | Shared/ Unique | Bit Description                                                                                                                                                                                                                                                                                         |
|------------------|------|-----------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                 |                |                                                                                                                                                                                                                                                                                                         |
| 401H             | 1025 | IA32_MCO_STATUS | Unique         | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                           |
| 402H             | 1026 | IA32_MCO_ADDR   | Unique         | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 404H             | 1028 | IA32_MC1_CTL    | Unique         | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                              |
| 405H             | 1029 | IA32_MC1_STATUS | Unique         | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                           |
| 406H             | 1030 | IA32_MC1_ADDR   | Unique         | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 408H             | 1032 | IA32_MC2_CTL    | Unique         | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                              |
| 409H             | 1033 | IA32_MC2_STATUS | Unique         | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                           |
| 40AH             | 1034 | IA32_MC2_ADDR   | Unique         | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 40CH             | 1036 | MSR_MC4_CTL     | Unique         | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."                                                                                                                                                                                                                                                              |
| 40DH             | 1037 | MSR_MC4_STATUS  | Unique         | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."                                                                                                                                                                                                                                                           |

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

| Register Address |      | Register Name         | Shared/ Unique | Bit Description                                                                                                                                                                                                                                                                                     |
|------------------|------|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                       |                |                                                                                                                                                                                                                                                                                                     |
| 40EH             | 1038 | MSR_MC4_ADDR          | Unique         | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 410H             | 1040 | MSR_MC3_CTL           |                | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                          |
| 411H             | 1041 | MSR_MC3_STATUS        |                | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."                                                                                                                                                                                                                                                       |
| 412H             | 1042 | MSR_MC3_ADDR          | Unique         | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 413H             | 1043 | MSR_MC3_MISC          | Unique         |                                                                                                                                                                                                                                                                                                     |
| 414H             | 1044 | MSR_MC5_CTL           | Unique         |                                                                                                                                                                                                                                                                                                     |
| 415H             | 1045 | MSR_MC5_STATUS        | Unique         |                                                                                                                                                                                                                                                                                                     |
| 416H             | 1046 | MSR_MC5_ADDR          | Unique         |                                                                                                                                                                                                                                                                                                     |
| 417H             | 1047 | MSR_MC5_MISC          | Unique         |                                                                                                                                                                                                                                                                                                     |
| 480H             | 1152 | IA32_VMX_BASIC        | Unique         | Reporting Register of Basic VMX Capabilities. (R/O). see Table B-2<br>See Appendix G.1, "Basic VMX Information" (If CPUID.01H:ECX.[bit 9])                                                                                                                                                          |
| 481H             | 1153 | IA32_VMX_PINBASED_CTL | Unique         | Capability Reporting Register of Pin-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls" (If CPUID.01H:ECX.[bit 9])                                                                                                                                                     |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

| Register Address |      | Register Name           | Shared/Unique | Bit Description                                                                                                                                               |
|------------------|------|-------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                         |               |                                                                                                                                                               |
| 482H             | 1154 | IA32_VMX_PROCBASED_CTLs | Unique        | Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O)<br>See Appendix G.3, "VM-Execution Controls" (If CPUID.01H:ECX.[bit 9]) |
| 483H             | 1155 | IA32_VMX_EXIT_CTLs      | Unique        | Capability Reporting Register of VM-exit Controls. (R/O)<br>See Appendix G.4, "VM-Exit Controls" (If CPUID.01H:ECX.[bit 9])                                   |
| 484H             | 1156 | IA32_VMX_ENTRY_CTLs     | Unique        | Capability Reporting Register of VM-entry Controls. (R/O)<br>See Appendix G.5, "VM-Entry Controls" (If CPUID.01H:ECX.[bit 9])                                 |
| 485H             | 1157 | IA32_VMX_MISC           | Unique        | Reporting Register of Miscellaneous VMX Capabilities. (R/O)<br>See Appendix G.6, "Miscellaneous Data" (If CPUID.01H:ECX.[bit 9])                              |
| 486H             | 1158 | IA32_VMX_CRO_FIXED0     | Unique        | Capability Reporting Register of CRO Bits Fixed to 0. (R/O)<br>See Appendix G.7, "VMX-Fixed Bits in CRO" (If CPUID.01H:ECX.[bit 9])                           |
| 487H             | 1159 | IA32_VMX_CRO_FIXED1     | Unique        | Capability Reporting Register of CRO Bits Fixed to 1. (R/O)<br>See Appendix G.7, "VMX-Fixed Bits in CRO" (If CPUID.01H:ECX.[bit 9])                           |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0     | Unique        | Capability Reporting Register of CR4 Bits Fixed to 0. (R/O)<br>See Appendix G.8, "VMX-Fixed Bits in CR4" (If CPUID.01H:ECX.[bit 9])                           |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1     | Unique        | Capability Reporting Register of CR4 Bits Fixed to 1. (R/O)<br>See Appendix G.8, "VMX-Fixed Bits in CR4" (If CPUID.01H:ECX.[bit 9])                           |

## B.10 MSRS IN THE PENTIUM M PROCESSOR

Model-specific registers (MSRs) for the Pentium M processor are similar to those described in Section B.11 for P6 family processors. The following table describes new MSRs and MSRs whose behavior has changed on the Pentium M processor.

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-17. MSRs in Pentium M Processors

| Register Address |     | Register Name           | Bit Description                                                                                                                                                    |
|------------------|-----|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                         |                                                                                                                                                                    |
| 0H               | 0   | P5_MC_ADDR              | See Appendix B.12, "MSRs in Pentium Processors."                                                                                                                   |
| 1H               | 1   | P5_MC_TYPE              | See Appendix B.12, "MSRs in Pentium Processors."                                                                                                                   |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER | See Section 16.12, "Time-Stamp Counter." and see Table B-2                                                                                                         |
| 17H              | 23  | IA32_PLATFORM_ID        | Platform ID. (R) see Table B-2<br>The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load. |
| 2AH              | 42  | MSR_EBL_CR_POWERON      | Processor Hard Power-On Configuration.<br>(R/W) Enables and disables processor features. (R)<br>Indicates current processor configuration.                         |
|                  |     | 0                       | Reserved.                                                                                                                                                          |
|                  |     | 1                       | Data Error Checking Enable. (R)<br>0 = Disabled<br>Always 0 on the Pentium M processor.                                                                            |
|                  |     | 2                       | <b>Response Error Checking Enable.</b> (R)<br>0 = Disabled<br>Always 0 on the Pentium M processor.                                                                 |
|                  |     | 3                       | MCERR# Drive Enable. (R)<br>0 = Disabled<br>Always 0 on the Pentium M processor.                                                                                   |
|                  |     | 4                       | Address Parity Enable. (R)<br>0 = Disabled<br>Always 0 on the Pentium M processor.                                                                                 |
|                  |     | 6:5                     | Reserved.                                                                                                                                                          |
|                  |     | 7                       | BINIT# Driver Enable. (R)<br>1 = Enabled; 0 = Disabled<br>Always 0 on the Pentium M processor.                                                                     |
|                  |     | 8                       | Output Tri-state Enabled. (R/O)<br>1 = Enabled; 0 = Disabled                                                                                                       |
|                  |     | 9                       | Execute BIST. (R/O)<br>1 = Enabled; 0 = Disabled                                                                                                                   |

Table B-17. MSRs in Pentium M Processors (Contd.)

| Register Address |     | Register Name    | Bit Description                                                                                                                                                                                                                                                                                                                                                                   |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-17. MSRs in Pentium M Processors (Contd.)

| Register Address |     | Register Name | Bit Description                                                                                                                                                                                                                                                                                                          |
|------------------|-----|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |               |                                                                                                                                                                                                                                                                                                                          |
|                  |     | 12            | Precise Event Based Sampling Unavailable. (RO)<br>1 = Processor does not support precise event-based sampling (PEBS);<br>0 = PEBS is supported.<br>The Pentium M processor does not support PEBS.                                                                                                                        |
|                  |     | 15:13         | Reserved.                                                                                                                                                                                                                                                                                                                |
|                  |     | 16            | Enhanced Intel SpeedStep Technology Enable. (R/W)<br>1 = Enhanced Intel SpeedStep Technology enabled.<br>On the Pentium M processor, this bit may be configured to be read-only.                                                                                                                                         |
|                  |     | 22:17         | Reserved.                                                                                                                                                                                                                                                                                                                |
|                  |     | 23            | xTPR Message Disable. (R/W)<br>When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority. The default is processor specific.                                                                                                         |
|                  |     | 63:24         | Reserved.                                                                                                                                                                                                                                                                                                                |
|                  |     | 1C9H          | MSR_LASTBRANCH_TOS. (R)<br>Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See also: <ul style="list-style-type: none"><li>▪ MSR_LASTBRANCH_0_FROM_IP (at 40H)</li><li>▪ Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)"</li></ul> |
| 1D9H             | 473 | MSR_DEBUGCTLB | Debug Control. (R/W)<br>Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."                                                                                              |

Table B-17. MSRs in Pentium M Processors (Contd.)

| Register Address |      | Register Name      | Bit Description                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                    |                                                                                                                                                                                                                                                                                                                                                                                                    |
| 1DDH             | 477  | MSR_LER_TO_LIP     | Last Exception Record To Linear IP. (R)<br>This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.<br>See Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 16.11.2, "Last Branch and Last Exception MSRs." |
| 1DEH             | 478  | MSR_LER_FROM_LIP   | Last Exception Record From Linear IP. (R)<br>Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.<br>See Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 16.11.2, "Last Branch and Last Exception MSRs."                       |
| 2FFH             | 767  | IA32_MTRR_DEF_TYPE | Default Memory Types. (R/W)<br>Sets the memory type for the regions of physical memory that are not mapped by the MTRRs.<br>See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR."                                                                                                                                                                                                                       |
| 400H             | 1024 | IA32_MCO_CTL       | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                                                                                                                         |
| 401H             | 1025 | IA32_MCO_STATUS    | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."                                                                                                                                                                                                                                                                                                                                                      |
| 402H             | 1026 | IA32_MCO_ADDR      | See Section 14.3.2.3., "IA32_MCi_ADDR MSRs".<br>The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MCO_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.                                                                                      |
| 404H             | 1028 | IA32_MC1_CTL       | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                                                                                                                         |
| 405H             | 1029 | IA32_MC1_STATUS    | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."                                                                                                                                                                                                                                                                                                                                                      |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-17. MSRs in Pentium M Processors (Contd.)

| Register Address |      | Register Name   | Bit Description                                                                                                                                                                                                                                                                                           |
|------------------|------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec  |                 |                                                                                                                                                                                                                                                                                                           |
| 406H             | 1030 | IA32_MC1_ADDR   | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 408H             | 1032 | IA32_MC2_CTL    | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                                |
| 409H             | 1033 | IA32_MC2_STATUS | See Chapter 15.3.2.2, "IA32_MCi_STATUS MSRs."                                                                                                                                                                                                                                                             |
| 40AH             | 1034 | IA32_MC2_ADDR   | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 40CH             | 1036 | MSR_MC4_CTL     | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                                                                                                                                                                                                                                                                |

## B.11 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table B-2 for a list of the architectural MSRs.

Table B-18. MSRs in the P6 Family Processors

| Register Address |     | Register Name    | Bit Description                                                                                                                                      |
|------------------|-----|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                  |                                                                                                                                                      |
| 0H               | 0   | P5_MC_ADDR       | See Appendix B.12, "MSRs in Pentium Processors."                                                                                                     |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-18. MSRs in the P6 Family Processors (Contd.)

| Register Address |     | Register Name      | Bit Description                                                                                         |
|------------------|-----|--------------------|---------------------------------------------------------------------------------------------------------|
| Hex              | Dec |                    |                                                                                                         |
|                  |     | BBL_CR_CTL[4:0]    | L2 Command                                                                                              |
|                  |     | 01100              | Data Read w/ LRU update (RLU)                                                                           |
|                  |     | 01110              | Tag Read w/ Data Read (TRR)                                                                             |
|                  |     | 01111              | Tag Inquire (TI)                                                                                        |
|                  |     | 00010              | L2 Control Register Read (CR)                                                                           |
|                  |     | 00011              | L2 Control Register Write (CW)                                                                          |
|                  |     | 010 + MESI encode  | Tag Write w/ Data Read (TWR)                                                                            |
|                  |     | 111 + MESI encode  | Tag Write w/ Data Write (TWW)                                                                           |
|                  |     | 100 + MESI encode  | Tag Write (TW)                                                                                          |
| 11A              | 282 | BBL_CR_TRIG        | Trigger register: used to initiate a cache configuration accesses access, Write only with Data = 0.     |
| 11B              | 283 | BBL_CR_BUSY        | Busy register: indicates when a cache configuration accesses L2 command is in progress. D[0] = 1 = BUSY |
| 11E              | 286 | BBL_CR_CTL3        | Control register 3: used to configure the L2 Cache                                                      |
|                  |     | BBL_CR_CTL3[63:26] | Reserved                                                                                                |
|                  |     | BBL_CR_CTL3[25]    | Cache bus fraction (read only)                                                                          |
|                  |     | BBL_CR_CTL3[24]    | Reserved                                                                                                |
|                  |     | BBL_CR_CTL3[23]    | L2 Hardware Disable (read only)                                                                         |
|                  |     | BBL_CR_CTL3[22:20] | L2 Physical Address Range support                                                                       |
|                  |     | 111                | 64GBytes                                                                                                |
|                  |     | 110                | 32GBytes                                                                                                |
|                  |     | 101                | 16GBytes                                                                                                |
|                  |     | 100                | 8GBytes                                                                                                 |
|                  |     | 011                | 4GBytes                                                                                                 |
|                  |     | 010                | 2GBytes                                                                                                 |
|                  |     | 001                | 1GBytes                                                                                                 |
|                  |     | 000                | 512MBytes                                                                                               |
|                  |     | BBL_CR_CTL3[19]    | Reserved                                                                                                |
|                  |     | BBL_CR_CTL3[18]    | Cache State error checking enable (read/write)                                                          |

|                  |      | 58               | MC_STATUS_ADDRV                                                             |
|                  |      | 59               | MC_STATUS_MISCV                                                             |
|                  |      | 60               | MC_STATUS_EN. (Note: For MCO_STATUS only, this bit is hardcoded to 1.)      |
|                  |      | 61               | MC_STATUS_UC                                                                |
|                  |      | 62               | MC_STATUS_O                                                                 |
|                  |      | 63               | MC_STATUS_V                                                                 |
| 402H             | 1026 | MCO_ADDR         |                                                                             |
| 403H             | 1027 | MCO_MISC         | Defined in MCA architecture but not implemented in the P6 family processors |

MODEL-SPECIFIC REGISTERS (MSRs)

Table B-18. MSRs in the P6 Family Processors (Contd.)

| Register Address |      | Register Name | Bit Description                                                                      |
|------------------|------|---------------|--------------------------------------------------------------------------------------|
| Hex              | Dec  |               |                                                                                      |
| 404H             | 1028 | MC1_CTL       |                                                                                      |
| 405H             | 1029 | MC1_STATUS    | Bit definitions same as MCO_STATUS                                                   |
| 406H             | 1030 | MC1_ADDR      |                                                                                      |
| 407H             | 1031 | MC1_MISC      | Defined in MCA architecture but not implemented in the P6 family processors          |
| 408H             | 1032 | MC2_CTL       |                                                                                      |
| 409H             | 1033 | MC2_STATUS    | Bit definitions same as MCO_STATUS                                                   |
| 40AH             | 1034 | MC2_ADDR      |                                                                                      |
| 40BH             | 1035 | MC2_MISC      | Defined in MCA architecture but not implemented in the P6 family processors          |
| 40CH             | 1036 | MC4_CTL       |                                                                                      |
| 40DH             | 1037 | MC4_STATUS    | Bit definitions same as MCO_STATUS, except bits 0, 4, 57, and 61 are hardcoded to 1. |
| 40EH             | 1038 | MC4_ADDR      | Defined in MCA architecture but not implemented in P6 Family processors              |
| 40FH             | 1039 | MC4_MISC      | Defined in MCA architecture but not implemented in the P6 family processors          |
| 410H             | 1040 | MC3_CTL       |                                                                                      |
| 411H             | 1041 | MC3_STATUS    | Bit definitions same as MCO_STATUS                                                   |
| 412H             | 1042 | MC3_ADDR      |                                                                                      |
| 413H             | 1043 | MC3_MISC      | Defined in MCA architecture but not implemented in the P6 family processors          |

NOTES

1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors.
2. The processor number feature may be disabled by setting bit 21 of the BBL\_CR\_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL\_CR\_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset.
3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.

## B.12 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5\_MC\_ADDR, P5\_MC\_TYPE, and TSC MSRs (named IA32\_P5\_MC\_ADDR, IA32\_P5\_MC\_TYPE, and IA32\_TIME\_STAMP\_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section B.1, “Architectural MSRs”). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.

Table B-19. MSRs in the Pentium Processor

| Register Address |     | Register Name | Bit Description                                                            |
|------------------|-----|---------------|----------------------------------------------------------------------------|
| Hex              | Dec |               |                                                                            |

MODEL-SPECIFIC REGISTERS (MSRS)

## APPENDIX C

### MP INITIALIZATION FOR P6 FAMILY PROCESSORS

---

This appendix describes the MP initialization process for systems that use multiple P6 family processors. This process uses the MP initialization protocol that was introduced with the Pentium Pro processor (see Section 8.4, “Multiple-Processor (MP) Initialization”). For P6 family processors, this protocol is typically used to boot 2 or 4 processors that reside on single system bus; however, it can support from 2 to 15 processors in a multi-clustered system when the APIC busses are tied together. Larger systems are not supported.

#### C.1 OVERVIEW OF THE MP INITIALIZATION PROCESS FOR P6 FAMILY PROCESSORS

During the execution of the MP initialization protocol, one processor is selected as the bootstrap processor (BSP) and the remaining processors are designated as application processors (APs), see Section 8.4.1, “BSP and AP Processors.” Thereafter, the BSP manages the initialization of itself and the APs. This initialization includes executing BIOS initialization code and operating-system initialization code.

The MP protocol imposes the following requirements and restrictions on the system:

- An APIC clock (APICLK) must be provided.
- The MP protocol will be executed only after a power-up or RESET. If the MP protocol has been completed and a BSP has been chosen, subsequent INITs (either to a specific processor or system wide) do not cause the MP protocol to be repeated. Instead, each processor examines its BSP flag (in the APIC\_BASE MSR) to determine whether it should execute the BIOS boot-strap code (if it is the BSP) or enter a wait-for-SIPI state (if it is an AP).
- All devices in the system that are capable of delivering interrupts to the processors must be inhibited from doing so for the duration of the MP initialization protocol. The time during which interrupts must be inhibited includes the window between when the BSP issues an INIT-SIPI-SIPI sequence to an AP and when the AP responds to the last SIPI in the sequence.

The following special-purpose interprocessor interrupts (IPIs) are used during the boot phase of the MP initialization protocol. These IPIs are broadcast on the APIC bus.

- **Boot IPI (BIPI)**—Initiates the arbitration mechanism that selects a BSP from the group of processors on the system bus and designates the remainder of the processors as APs. Each processor on the system bus broadcasts a BIPI to all the processors following a power-up or RESET.

## MP INITIALIZATION FOR P6 FAMILY PROCESSORS

- **Final Boot IPI (FUPI)**—Initiates the BIOS initialization procedure for the BSP. This IPI is broadcast to all the processors on the system bus, but only the BSP responds to it. The BSP responds by beginning execution of the BIOS initialization code at the reset vector.
- **Startup IPI (SUPI)**—Initiates the initialization procedure for an AP. The SUPI message contains a vector to the AP initialization code in the BIOS.

Table C-1 describes the various fields of the boot phase IPIs.

**Table C-1. Boot Phase IPI Message Format**

| Type | Destination Field | Destination Shorthand | Trigger Mode | Level    | Destination Mode | Delivery Mode | Vector (Hex) |
|------|-------------------|-----------------------|--------------|----------|------------------|---------------|--------------|
| BUPI | Not used          | All including self    | Edge         | Deassert | Don't Care       | Fixed (000)   | 40 to 4E*    |
| FUPI | Not used          | All including self    | Edge         | Deassert | Don't Care       | Fixed (000)   | 10           |
| SUPI | Used              | All excluding self    | Edge         | Assert   | Physical         | StartUp (110) | 00 to FF     |

**NOTE:**

\* For all P6 family processors.

For BUPI messages, the lower 4 bits of the vector field contain the APIC ID of the processor issuing the message and the upper 4 bits contain the “generation ID” of the message. All P6 family processor will have a generation ID of 4H. BUPIs will therefore use vector values ranging from 40H to 4EH (4FH can not be used because FH is not a valid APIC ID).

## C.2 MP INITIALIZATION PROTOCOL ALGORITHM

Following a power-up or RESET of a system, the P6 family processors in the system execute the MP initialization protocol algorithm to initialize each of the processors on the system bus. In the course of executing this algorithm, the following boot-up and initialization operations are carried out:

1. Each processor on the system bus is assigned a unique APIC ID, based on system topology (see Section 8.4.5, “Identifying Logical Processors in an MP System”). This ID is written into the local APIC ID register for each processor.
2. Each processor executes its internal BIST simultaneously with the other processors on the system bus. Upon completion of the BIST (at T0), each processor broadcasts a BUPI to “all including self” (see Figure 1).
3. APIC arbitration hardware causes all the APICs to respond to the BUPIs one at a time (at T1, T2, T3, and T4).
4. When the first BUPI is received (at time T1), each APIC compares the four least significant bits of the BUPI’s vector field with its APIC ID. If the vector and APIC ID match, the processor selects itself as the BSP by setting the BSP flag in its

IA32\_APIC\_BASE MSR. If the vector and APIC ID do not match, the processor selects itself as an AP by entering the “wait for SIPI” state. (Note that in Figure 1, the BPIPI from processor 1 is the first BPIPI to be handled, so processor 1 becomes the BSP.)

5. The newly established BSP broadcasts an FIPI message to “all including self.” The FIPI is guaranteed to be handled only after the completion of the BPIPIs that were issued by the non-BSP processors.

Figure C-1. MP System With Multiple Pentium III Processors

6. After the BSP has been established, the outstanding BPIPIs are received one at a time (at T2, T3, and T4) and ignored by all processors.
7. When the FIPI is finally received (at T5), only the BSP responds to it. It responds by fetching and executing BIOS boot-strap code, beginning at the reset vector (physical address FFFF FFFOH).
8. As part of the boot-strap procedure, the BSP creates an ACPI table and an MP table and adds its initial APIC ID to these tables as appropriate.
9. At the end of the boot-strap procedure, the BSP broadcasts a SIPI message to all the APs in the system. Here, the SIPI message contains a vector to the BIOS AP initialization code (at 000V V000H, where VV is the vector contained in the SIPI message).
10. All APs respond to the SIPI message by racing to a BIOS initialization semaphore. The first one to the semaphore begins executing the initialization code. (See MP init code for semaphore implementation details.) As part of the AP initialization procedure, the AP adds its APIC ID number to the ACPI and MP tables as appro-

## MP INITIALIZATION FOR P6 FAMILY PROCESSORS

priate. At the completion of the initialization procedure, the AP executes a CLI instruction (to clear the IF flag in the EFLAGS register) and halts itself.

11. When each of the APs has gained access to the semaphore and executed the AP initialization code and all written their APIC IDs into the appropriate places in the ACPI and MP tables, the BSP establishes a count for the number of processors connected to the system bus, completes executing the BIOS boot-strap code, and then begins executing operating-system boot-strap and start-up code.
12. While the BSP is executing operating-system boot-strap and start-up code, the APs remain in the halted state. In this state they will respond only to INITs, NMIs, and SMIs. They will also respond to snoops and to assertions of the STPCLK# pin.

See Section 8.4.4, “MP Initialization Example,” for an annotated example the use of the MP protocol to boot IA-32 processors in an MP. This code should run on any IA-32 processor that used the MP protocol.

### C.2.1 Error Detection and Handling During the MP Initialization Protocol

Errors may occur on the APIC bus during the MP initialization phase. These errors may be transient or permanent and can be caused by a variety of failure mechanisms (for example, broken traces, soft errors during bus usage, etc.). All serial bus related errors will result in an APIC checksum or acceptance error.

The MP initialization protocol makes the following assumptions regarding errors that occur during initialization:

- If errors are detected on the APIC bus during execution of the MP initialization protocol, the processors that detect the errors are shut down.
- The MP initialization protocol will be executed by processors even if they fail their BIST sequences.

## APPENDIX D PROGRAMMING THE LINT0 AND LINT1 INPUTS

---

The following procedure describes how to program the LINT0 and LINT1 local APIC pins on a processor after multiple processors have been booted and initialized (as described in Appendix C, "MP Initialization For P6 Family Processors," and Appendix D, "Programming the LINT0 and LINT1 Inputs." In this example, LINT0 is programmed to be the ExtINT pin and LINT1 is programmed to be the NMI pin.

### D.1 CONSTANTS

The following constants are defined:

```
LVT1EQU OFEE00350H  
LVT2EQU OFEE00360H  
LVT3 EQU OFEE00370H  
SVR EQU OFEE000FOH
```

### D.2 LINT[0:1] PINS PROGRAMMING PROCEDURE

Use the following to program the LINT[1:0] pins:

1. Mask 8259 interrupts.
2. Enable APIC via SVR (spurious vector register) if not already enabled.

```
MOV ESI, SVR           ; address of SVR  
MOV EAX, [ESI]  
OR EAX, APIC_ENABLED  ; set bit 8 to enable (0 on reset)  
MOV [ESI], EAX
```

3. Program LVT1 as an ExtINT which delivers the signal to the INTR signal of all processors cores listed in the destination as an interrupt that originated in an externally connected interrupt controller.

```
MOV ESI, LVT1  
MOV EAX, [ESI]  
AND EAX, OFFE58FFH; mask off bits 8-10, 12, 14 and 16  
OR EAX, 700H; Bit 16=0 for not masked, Bit 15=0 for edge  
; triggered, Bit 13=0 for high active input  
; polarity, Bits 8-10 are 111b for ExtINT  
MOV [ESI], EAX; Write to LVT1
```

## PROGRAMMING THE LINT0 AND LINT1 INPUTS

4. Program LVT2 as NMI, which delivers the signal on the NMI signal of all processor cores listed in the destination.

```
MOV ESI, LVT2
MOV EAX, [ESI]
AND EAX, OFFFE58FFH; mask off bits 8-10 and 15
OR EAX, 000000400H; Bit 16=0 for not masked, Bit 15=0 edge
; triggered, Bit 13=0 for high active input
; polarity, Bits 8-10 are 100b for NMI
MOV [ESI], EAX; Write to LVT2
;Unmask 8259 interrupts and allow NMI.
```

## APPENDIX E INTERPRETING MACHINE-CHECK ERROR CODES

---

Encoding of the model-specific and other information fields is different across processor families. The differences are documented in the following sections.

### E.1 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY 06H MACHINE ERROR CODES FOR MACHINE CHECK

Section E.1 provides information for interpreting additional model-specific fields for external bus errors relating to processor family 06H. The references to processor family 06H refers to only IA-32 processors with CPUID signatures listed in Table E-1.

**Table E-1. CPUID DisplayFamily\_DisplayModel Signatures for Processor Family 06H**

| DisplayFamily_DisplayModel       | Processor Families/Processor Number Series                    |
|----------------------------------|---------------------------------------------------------------|
| 06_0EH                           | Intel Core Duo, Intel Core Solo processors                    |
| 06_0DH                           | Intel Pentium M processor                                     |
| 06_09H                           | Intel Pentium M processor                                     |
| 06_7H, 06_08H, 06_0AH,<br>06_0BH | Intel Pentium III Xeon Processor, Intel Pentium III Processor |
| 06_03H, 06_05H                   | Intel Pentium II Xeon Processor, Intel Pentium II Processor   |
| 06_01H                           | Intel Pentium Pro Processor                                   |

These errors are reported in the IA32\_MCI\_STATUS MSRs. They are reported architecturally as compound errors with a general form of *0000 1PPT RRRR IILL* in the MCA error code field. See Chapter 15 for information on the interpretation of compound error codes. Incremental decoding information is listed in Table E-2.

## INTERPRETING MACHINE-CHECK ERROR CODES

**Table E-2. Incremental Decoding Information: Processor Family 06H  
Machine Error Codes For Machine Check**

| Type                         | Bit No. | Bit Function           | Bit Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Other information     | 32-34   | Reserved              | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                       | 35      | External BINIT        | 1 if BINIT is received from external bus.                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                       | 36      | Response parity error | This bit is asserted in IA32_MCi_STATUS if this component has received a parity error on the RS[2:0]# pins for a response transaction. The RS signals are checked by the RSP# external pin.                                                                                                                                                                                                                                                                          |
|                       | 37      | Bus BINIT             | This bit is asserted in IA32_MCi_STATUS if this component has received a hard error response on a split transaction one access that has needed to be split across the 64-bit external bus interface into two accesses).                                                                                                                                                                                                                                              |
|                       | 38      | Timeout BINIT         | This bit is asserted in IA32_MCi_STATUS if this component has experienced a ROB time-out, which indicates that no micro-instruction has been retired for a predetermined period of time.<br><br>A ROB time-out occurs when the 15-bit ROB time-out counter carries a 1 out of its high order bit. <sup>2</sup> The timer is cleared when a micro-instruction retires, an exception is detected by the core processor, RESET is asserted, or when a ROB BINIT occurs. |

## INTERPRETING MACHINE-CHECK ERROR CODES

**Table E-2. Incremental Decoding Information: Processor Family 06H  
Machine Error Codes For Machine Check (Contd.)**

| Type | Bit No. | Bit Function | Bit Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------|---------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      |         |              | The ROB time-out counter is prescaled by the 8-bit PIC timer which is a divide by 128 of the bus clock (the bus clock is 1:2, 1:3, 1:4 of the core clock). When a carry out of the 8-bit PIC timer occurs, the ROB counter counts up by one. While this bit is asserted, it cannot be overwritten by another error.                                                                                                                                                                                          |
|      | 39-41   | Reserved     | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|      | 42      | Hard error   | This bit is asserted in IA32_MCI_STATUS if this component has initiated a bus transactions which has received a hard error response. While this bit is asserted, it cannot be overwritten.                                                                                                                                                                                                                                                                                                                   |
|      | 43      | IERR         | This bit is asserted in IA32_MCI_STATUS if this component has experienced a failure that causes the IERR pin to be asserted. While this bit is asserted, it cannot be overwritten.                                                                                                                                                                                                                                                                                                                           |
|      | 44      | AERR         | This bit is asserted in IA32_MCI_STATUS if this component has initiated 2 failing bus transactions which have failed due to Address Parity Errors (AERR asserted). While this bit is asserted, it cannot be overwritten.                                                                                                                                                                                                                                                                                     |
|      | 45      | UECC         | The Uncorrectable ECC error bit is asserted in IA32_MCI_STATUS for uncorrected ECC errors. While this bit is asserted, the ECC syndrome field will not be overwritten.                                                                                                                                                                                                                                                                                                                                       |
|      | 46      | CECC         | The correctable ECC error bit is asserted in IA32_MCI_STATUS for corrected ECC errors.                                                                                                                                                                                                                                                                                                                                                                                                                       |
|      | 47-54   | ECC syndrome | The ECC syndrome field in IA32_MCI_STATUS contains the 8-bit ECC syndrome only if the error was a correctable/uncorrectable ECC error and there wasn't a previous valid ECC error syndrome logged in IA32_MCI_STATUS. A previous valid ECC error in IA32_MCI_STATUS is indicated by IA32_MCI_STATUS.bit45 (uncorrectable error occurred) being asserted. After processing an ECC error, machine-check handling software should clear IA32_MCI_STATUS.bit45 so that future ECC error syndromes can be logged. |

**Table E-2. Incremental Decoding Information: Processor Family 06H  
Machine Error Codes For Machine Check (Contd.)**

| Type                                             | Bit No. | Bit Function | Bit Description |
|--------------------------------------------------|---------|--------------|-----------------|
|                                                  | 55-56   | Reserved     | Reserved.       |
| Status register validity indicators <sup>1</sup> | 57-63   |              |                 |

**NOTES:**

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.
2. For processors with a CPUID signature of 06\_0EH, a ROB time-out occurs when the 23-bit ROB time-out counter carries a 1 out of its high order bit.

## **E.2 INCREMENTAL DECODING INFORMATION: INTEL CORE 2 PROCESSOR FAMILY MACHINE ERROR CODES FOR MACHINE CHECK**

Table E-4 provides information for interpreting additional model-specific fields for external bus errors relating to processor based on Intel Core microarchitecture, which implements the P4 bus specification. Table E-3 lists the CPUID signatures for Intel 64 processors that are covered by Table E-4. These errors are reported in the IA32\_MCI\_STATUS MSRs. They are reported architecturally) as compound errors with a general form of *0000 1PPT RRRR /ILL* in the MCA error code field. See Chapter 15 for information on the interpretation of compound error codes.

**Table E-3. CPUID DisplayFamily\_DisplayModel Signatures for Processors Based on  
Intel Core Microarchitecture**

| DisplayFamily_DisplayModel | Processor Families/Processor Number Series                                                                                                                         |

## INTERPRETING MACHINE-CHECK ERROR CODES

**Table E-4. Incremental Bus Error Codes of Machine Check for Processors Based on Intel Core Microarchitecture**

| Type                         | Bit No. | Bit Function           | Bit Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                       | 36      | Response parity error   | This bit is asserted in IA32_MCi_STATUS if this component has received a parity error on the RS[2:0]# pins for a response transaction. The RS signals are checked by the RSP# external pin.                                                                                                                                                                                                                                                             |
|                       | 37      | FSB address parity      | Address parity error detected:<br>1 = Address parity error detected<br>0 = No address parity error                                                                                                                                                                                                                                                                                                                                                      |
|                       | 38      | Timeout BINIT           | This bit is asserted in IA32_MCi_STATUS if this component has experienced a ROB time-out, which indicates that no micro-instruction has been retired for a predetermined period of time.<br><br>A ROB time-out occurs when the 23-bit ROB time-out counter carries a 1 out of its high order bit. The timer is cleared when a micro-instruction retires, an exception is detected by the core processor, RESET is asserted, or when a ROB BINIT occurs. |

## INTERPRETING MACHINE-CHECK ERROR CODES

**Table E-4. Incremental Bus Error Codes of Machine Check for Processors Based on Intel Core Microarchitecture**

| Type                                             | Bit No. | Bit Function | Bit Description                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------|---------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                  |         |              | The ROB time-out counter is prescaled by the 8-bit PIC timer which is a divide by 128 of the bus clock (the bus clock is 1:2, 1:3, 1:4 of the core clock). When a carry out of the 8-bit PIC timer occurs, the ROB counter counts up by one. While this bit is asserted, it cannot be overwritten by another error. |
|                                                  | 39-41   | Reserved     | Reserved                                                                                                                                                                                                                                                                                                            |
|                                                  | 42      | Hard error   | This bit is asserted in IA32_MCi_STATUS if this component has initiated a bus transactions which has received a hard error response. While this bit is asserted, it cannot be overwritten.                                                                                                                          |
|                                                  | 43      | IERR         | This bit is asserted in IA32_MCi_STATUS if this component has experienced a failure that causes the IERR pin to be asserted. While this bit is asserted, it cannot be overwritten.                                                                                                                                  |
|                                                  | 44      | Reserved     | Reserved                                                                                                                                                                                                                                                                                                            |
|                                                  | 45      | Reserved     | Reserved                                                                                                                                                                                                                                                                                                            |
|                                                  | 46      | Reserved     | Reserved                                                                                                                                                                                                                                                                                                            |
|                                                  | 47-54   | Reserved     | Reserved                                                                                                                                                                                                                                                                                                            |
|                                                  | 55-56   | Reserved     | Reserved.                                                                                                                                                                                                                                                                                                           |
| Status register validity indicators <sup>7</sup> | 57-63   |              |                                                                                                                                                                                                                                                                                                                     |

**NOTES:**

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

## E.2.1 Model-Specific Machine Check Error Codes for Intel Xeon Processor 7400 Series

Intel Xeon processor 7400 series has machine check register banks that generally follows the description of Chapter 15 and Section E.2. Additional error codes specific to Intel Xeon processor 7400 series is describe in this section.

MC4\_STATUS[63:0] is the main error logging for the processor's L3 and front side bus errors for Intel Xeon processor 7400 series. It supports the L3 Errors, Bus and Interconnect Errors Compound Error Codes in the MCA Error Code Field.

### E.2.1.1 Processor Machine Check Status Register Incremental MCA Error Code Definition

Intel Xeon processor 7400 series use compound MCA Error Codes for logging its Bus internal machine check errors, L3 Errors, and Bus/Interconnect Errors. It defines incremental Machine Check error types (IA32\_MC6\_STATUS[15:0]) beyond those defined in Chapter 15. Table E-5 lists these incremental MCA error code types that apply to IA32\_MC6\_STATUS. Error code details are specified in MC6\_STATUS [31:16] (see Section E.2.2), the "Model Specific Error Code" field. The information in the "Other\_Info" field (MC4\_STATUS[56:32]) is common to the three processor error types and contains a correctable event count and specifies the MC6\_MISC register format.

Table E-5. Incremental MCA Error Code Types for Intel Xeon Processor 7400

| Processor MCA_Error_Code (MC6_STATUS[15:0]) |                            |                     |                                                                                         |
|---------------------------------------------|----------------------------|---------------------|-----------------------------------------------------------------------------------------|
| Type                                        | Error Code                 | Binary Encoding     | Meaning                                                                                 |
| C                                           | Internal Error             | 0000 0100 0000 0000 | Internal Error Type Code                                                                |
| B                                           | Bus and Interconnect Error | 0000 100x 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |
|                                             |                            | 0000 101x 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |
|                                             |                            | 0000 110x 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |
|                                             |                            | 0000 1110 0000 1111 | Bus and Interconnection Error Type Code                                                 |
|                                             |                            | 0000 1111 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |

## INTERPRETING MACHINE-CHECK ERROR CODES

The **Bold faced** binary encodings are the only encodings used by the processor for MC4\_STATUS[15:0].

### E.2.2 Intel Xeon Processor 7400 Model Specific Error Code Field

#### E.2.2.1 Processor Model Specific Error Code Field Type B: Bus and Interconnect Error

Note: The Model Specific Error Code field in MC6\_STATUS (bits 31:16)

**Table E-6. Type B Bus and Interconnect Error Codes**

| Bit Num | Sub-Field Name         | Description                                              |
|---------|------------------------|----------------------------------------------------------|
| 16      | FSB Request Parity     | Parity error detected during FSB request phase           |
| 19:17   |                        | Reserved                                                 |
| 20      | FSB Hard Fail Response | "Hard Failure" response received for a local transaction |
| 21      | FSB Response Parity    | Parity error on FSB response field detected              |
| 22      | FSB Data Parity        | FSB data parity error on inbound data detected           |
| 31:23   | ---                    | Reserved                                                 |

#### E.2.2.2 Processor Model Specific Error Code Field Type C: Cache Bus Controller Error

**Table E-7. Type C Cache Bus Controller Error Codes**

| MC4_STATUS[31:16] (MSCE) Value | Error Description                 |
|--------------------------------|-----------------------------------|
| 0000_0000_0000_0001 0x0001     | Inclusion Error from Core 0       |
| 0000_0000_0000_0010 0x0002     | Inclusion Error from Core 1       |
| 0000_0000_0000_0011 0x0003     | Write Exclusive Error from Core 0 |
| 0000_0000_0000_0100 0x0004     | Write Exclusive Error from Core 1 |
| 0000_0000_0000_0101 0x0005     | Inclusion Error from FSB          |
| 0000_0000_0000_0110 0x0006     | SNP Stall Error from FSB          |
| 0000_0000_0000_0111 0x0007     | Write Stall Error from FSB        |

**Table E-7. Type C Cache Bus Controller Error Codes**

| MC4_STATUS[31:16] (MSCE) Value | Error Description                                                                |
|--------------------------------|----------------------------------------------------------------------------------|
| 0000_0000_0000_1000 0x0008     | FSB Arb Timeout Error                                                            |
| 0000_0000_0000_1010 0x000A     | Inclusion Error from Core 2                                                      |
| 0000_0000_0000_1011 0x000B     | Write Exclusive Error from Core 2                                                |
| 0000_0010_0000_0000 0x0200     | Internal Timeout error                                                           |
| 0000_0011_0000_0000 0x0300     | Internal Timeout Error                                                           |
| 0000_0100_0000_0000 0x0400     | Intel® Cache Safe Technology Queue Full Error or Disabled-ways-in-a-set overflow |
| 0000_0101_0000_0000 0x0500     | Quiet cycle Timeout Error (correctable)                                          |
| 1100_0000_0000_0010 0xC002     | Correctable ECC event on outgoing Core 0 data                                    |
| 1100_0000_0000_0100 0xC004     | Correctable ECC event on outgoing Core 1 data                                    |
| 1100_0000_0000_1000 0xC008     | Correctable ECC event on outgoing Core 2 data                                    |
| 1110_0000_0000_0010 0xE002     | Uncorrectable ECC error on outgoing Core 0 data                                  |
| 1110_0000_0000_0100 0xE004     | Uncorrectable ECC error on outgoing Core 1 data                                  |
| 1110_0000_0000_1000 0xE008     | Uncorrectable ECC error on outgoing Core 2 data                                  |
| — all other encodings —        | Reserved                                                                         |

### **E.3 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY WITH CPUID DISPLAYFAMILY\_DISPLAYMODEL SIGNATURE 06\_1AH, MACHINE ERROR CODES FOR MACHINE CHECK**

Table E-8 through Table E-12 provide information for interpreting additional model-specific fields for memory controller errors relating to the processor family with CPUID DisplayFamily\_DisplaySignature 06\_1AH, which supports Intel QuickPath Interconnect links. Incremental MC error codes related to the Intel QPI links are reported in the register banks IA32\_MCO and IA32\_MC1, incremental error codes for internal machine check is reported in the register bank IA32\_MC7, and incremental error codes for the memory controller unit is reported in the register banks IA32\_MC8.

## INTERPRETING MACHINE-CHECK ERROR CODES

### E.3.1 Intel QPI Machine Check Errors

Table E-8. Intel QPI Machine Check Error Codes for IA32\_MCO\_STATUS and IA32\_MC1\_STATUS

| Type                                             | Bit No. | Bit Function             | Bit Description                                                        |
|--------------------------------------------------|---------|--------------------------|------------------------------------------------------------------------|
| MCA error codes <sup>1</sup>                     | 0-15    | MCACOD                   | Bus error format: 1PPTRRRRIILL                                         |
| Model specific errors                            |         |                          |                                                                        |
|                                                  | 16      | Header Parity            | If 1, QPI Header had bad parity                                        |
|                                                  | 17      | Data Parity              | If 1, QPI Data packet had bad parity                                   |
|                                                  | 18      | Retries Exceeded         | If 1, number of QPI retries was exceeded                               |
|                                                  | 19      | Received Poison          | If 1, Received a data packet that was marked as poisoned by the sender |
|                                                  | 21-20   | Reserved                 | Reserved                                                               |
|                                                  | 22      | Unsupported Message      | If 1, QPI received a message encoding it does not support              |
|                                                  | 23      | Unsupported Credit       | If 1, QPI credit type is not supported.                                |
|                                                  | 24      | Receive Flit Overrun     | If 1, Sender sent too many QPI flits to the receiver.                  |
|                                                  | 25      | Received Failed Response | If 1, Indicates that sender sent a failed response to receiver.        |
|                                                  | 26      | Receiver Clock Jitter    | If 1, clock jitter detected in the internal QPI clocking               |
|                                                  | 56-27   | Reserved                 | Reserved                                                               |
| Status register validity indicators <sup>1</sup> | 57-63   |                          |                                                                        |

| Model specific errors                            |         |                                   |                                                                                                                                                                                                                                                                                       |
|                                                  | 23-16   | Reserved                          | Reserved                                                                                                                                                                                                                                                                              |
|                                                  | 31-24   | Reserved except for the following | 00h - No Error<br>03h - Reset firmware did not complete<br>08h - Received an invalid CMPD<br>0Ah - Invalid Power Management Request<br>0Dh - Invalid S-state transition<br>11h - VID controller does not match POC controller selected<br>1Ah - MSID from POC does not match CPU MSID |
|                                                  | 56-32   | Reserved                          | Reserved                                                                                                                                                                                                                                                                              |
| Status register validity indicators <sup>1</sup> | 57-63   |                                   |                                                                                                                                                                                                                                                                                       |

## INTERPRETING MACHINE-CHECK ERROR CODES

### NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

### E.3.3 Memory Controller Errors

Table E-11. Incremental Memory Controller Error Codes of Machine Check for IA32\_MC8\_STATUS

| Type                                             | Bit No. | Bit Function             | Bit Description                         |
|--------------------------------------------------|---------|--------------------------|-----------------------------------------|
| MCA error codes <sup>1</sup>                     | 0-15    | MCACOD                   | Memory error format: 1MMMCCCC           |
| Model specific errors                            |         |                          |                                         |
|                                                  | 16      | Read ECC error           | If 1, ECC occurred on a read            |
|                                                  | 17      | RAS ECC error            | If 1, ECC occurred on a scrub           |
|                                                  | 18      | Write parity error       | If 1, bad parity on a write             |
|                                                  | 19      | Redundancy loss          | If 1, Error in half of redundant memory |
|                                                  | 20      | Reserved                 | Reserved                                |
|                                                  | 21      | Memory range error       | If 1, Memory access out of range        |
|                                                  | 22      | RTID out of range        | If 1, Internal ID invalid               |
|                                                  | 23      | Address parity error     | If 1, bad address parity                |
|                                                  | 24      | Byte enable parity error | If 1, bad enable parity                 |
| Other information                                | 37-25   | Reserved                 | Reserved                                |
|                                                  | 52:38   | CORE_ERR_CNT             | Corrected error count                   |
|                                                  | 56-53   | Reserved                 | Reserved                                |
| Status register validity indicators <sup>7</sup> | 57-63   |                          |                                         |

### NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

**Table E-12. Incremental Memory Controller Error Codes of Machine Check for IA32\_MC8\_MISC**

| Type                               | Bit No. | Bit Function | Bit Description                |
|------------------------------------|---------|--------------|--------------------------------|
| Model specific errors <sup>1</sup> |         |              |                                |
|                                    | 7-0     | RTId         | Transaction Tracker ID         |
|                                    | 15-8    | Reserved     | Reserved                       |
|                                    | 17-16   | DIMM         | DIMM ID which got the error    |
|                                    | 19-18   | Channel      | Channel ID which got the error |
|                                    | 31-20   | Reserved     | Reserved                       |
|                                    | 63-32   | Syndrome     | ECC Syndrome                   |

**NOTES:**

1. Which of these fields are valid depends on the error type.

**E.4 INCREMENTAL DECODING INFORMATION:  
PROCESSOR FAMILY WITH CPUID  
DISPLAYFAMILY\_DISPLAYMODEL SIGNATURE  
06\_2DH, MACHINE ERROR CODES FOR MACHINE  
CHECK**

Table E-8 through Table E-12 provide information for interpreting additional model-specific fields for memory controller errors relating to the processor family with CPUID DisplayFamily\_DisplaySignature 06\_2DH, which supports Intel QuickPath Interconnect links. Incremental MC error codes related to the Intel QPI links are reported in the register banks IA32\_MC6 and IA32\_MC7, incremental error codes for internal machine check error from PCU controller is reported in the register bank IA32\_MC4, and incremental error codes for the memory controller unit is reported in the register banks IA32\_MC8-IA32\_MC11.

## INTERPRETING MACHINE-CHECK ERROR CODES

### E.4.1 Internal Machine Check Errors

Table E-13. Machine Check Error Codes for IA32\_MC4\_STATUS

| Type                         | Bit No. | Bit Function                      | Bit Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## INTERPRETING MACHINE-CHECK ERROR CODES

| Type                                             | Bit No. | Bit Function | Bit Description |
|--------------------------------------------------|---------|--------------|-----------------|
|                                                  | 56-32   | Reserved     | Reserved        |
| Status register validity indicators <sup>7</sup> | 57-63   |              |                 |

**NOTES:**

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

## INTERPRETING MACHINE-CHECK ERROR CODES

### E.4.2 Intel QPI Machine Check Errors

Table E-14. Intel QPI MC Error Codes for IA32\_MC6\_STATUS and IA32\_MC7\_STATUS

| Type                                             | Bit No. | Bit Function | Bit Description                |
|--------------------------------------------------|---------|--------------|--------------------------------|
| MCA error codes <sup>1</sup>                     | 0-15    | MCACOD       | Bus error format: 1PPTRRRRIILL |
| Model specific errors                            |         |              |                                |
|                                                  | 56-16   | Reserved     | Reserved                       |
| Status register validity indicators <sup>7</sup> | 57-63   |              |                                |

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

### E.4.3 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the MSRs IA32\_MC8\_STATUS-IA32\_MC11\_STATUS. The supported error codes are follows the architectural MCACOD definition type 1MMMCCCC (see Chapter 15, "Machine-Check Architecture,").

## E.5 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY OFH MACHINE ERROR CODES FOR MACHINE CHECK

Table E-15 provides information for interpreting additional family OFH model-specific fields for external bus errors. These errors are reported in the IA32\_MCi\_STATUS MSRs. They are reported architecturally) as compound errors with a general form of *0000 1PPT RRRR IILL* in the MCA error code field. See Chapter 15 for information on the interpretation of compound error codes.

**Table E-15. Incremental Decoding Information: Processor Family OFH  
Machine Error Codes For Machine Check**

| Type                                             | Bit No. | Bit Function                                                                                  | Bit Description                                                                                                                                                                                                        |

**NOTES:**

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

Table E-10 provides information on interpreting additional family OFH, model specific fields for cache hierarchy errors. These errors are reported in one of the

## INTERPRETING MACHINE-CHECK ERROR CODES

IA32\_MCI\_STATUS MSRs. These errors are reported, architecturally, as compound errors with a general form of *0000 0001 RRRR TTLL* in the MCA error code field. See Chapter 15 for how to interpret the compound error code.

### E.5.1 Model-Specific Machine Check Error Codes for Intel Xeon Processor MP 7100 Series

Intel Xeon processor MP 7100 series has 5 register banks which contains information related to Machine Check Errors. MCI\_STATUS[63:0] refers to all 5 register banks. MC0\_STATUS[63:0] through MC3\_STATUS[63:0] is the same as on previous generation of Intel Xeon processors within Family OFH. MC4\_STATUS[63:0] is the main error logging for the processor's L3 and front side bus errors. It supports the L3 Errors, Bus and Interconnect Errors Compound Error Codes in the MCA Error Code Field.

Table E-16. MCI\_STATUS Register Bit Definition

| Bit Field Name            | Bits  | Description                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MCA_Error_Code            | 15:0  | Specifies the machine check architecture defined error code for the machine check error condition detected. The machine check architecture defined error codes are guaranteed to be the same for all Intel Architecture processors that implement the machine check architecture. See tables below                                                            |
| Model_Specific_Error_Code | 31:16 | Specifies the model specific error code that uniquely identifies the machine check error condition detected. The model specific error codes may differ among Intel Architecture processors for the same Machine Check Error condition. See tables below                                                                                                       |
| Other_Info                | 56:32 | The functions of the bits in this field are implementation specific and are not part of the machine check architecture. Software that is intended to be portable among Intel Architecture processors should not rely on the values in this field.                                                                                                             |
| PCC                       | 57    | Processor Context Corrupt flag indicates that the state of the processor might have been corrupted by the error condition detected and that reliable restarting of the processor may not be possible. When clear, this flag indicates that the error did not affect the processor's state. This bit will always be set for MC errors which are not corrected. |
| ADDRV                     | 58    | MC_ADDR register valid flag indicates that the MC_ADDR register contains the address where the error occurred. When clear, this flag indicates that the MC_ADDR register does not contain the address where the error occurred. The MC_ADDR register should not be read if the ADDRV bit is clear.                                                            |

Table E-16. MCi\_STATUS Register Bit Definition (Contd.)

| Bit Field Name | Bits | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MISCV          | 59   | MC_MISC register valid flag indicates that the MC_MISC register contains additional information regarding the error. When clear, this flag indicates that the MC_MISC register does not contain additional information regarding the error. MC_MISC should not be read if the MISCV bit is not set.                                                                                                                                                                                |
| EN             | 60   | Error enabled flag indicates that reporting of the machine check exception for this error was enabled by the associated flag bit of the MC_CTL register. Note that correctable errors do not have associated enable bits in the MC_CTL register so the EN bit should be clear when a correctable error is logged.                                                                                                                                                                  |
| UC             | 61   | Error uncorrected flag indicates that the processor did not correct the error condition. When clear, this flag indicates that the processor was able to correct the event condition.                                                                                                                                                                                                                                                                                               |
| OVER           | 62   | Machine check overflow flag indicates that a machine check error occurred while the results of a previous error were still in the register bank (i.e., the VAL bit was already set in the MC_STATUS register). The processor sets the OVER flag and software is responsible for clearing it. Enabled errors are written over disabled errors, and uncorrected errors are written over corrected events. Uncorrected errors are not written over previous valid uncorrected errors. |
| VAL            | 63   | MC_STATUS register valid flag indicates that the information within the MC_STATUS register is valid. When this flag is set, the processor follows the rules given for the OVER flag in the MC_STATUS register when overwriting previously valid entries. The processor sets the VAL flag and software is responsible for clearing it.                                                                                                                                              |

### E.5.1.1 Processor Machine Check Status Register MCA Error Code Definition

Intel Xeon processor MP 7100 series use compound MCA Error Codes for logging its CBC internal machine check errors, L3 Errors, and Bus/Interconnect Errors. It defines additional Machine Check error types (IA32\_MC4\_STATUS[15:0]) beyond those defined in Chapter 15. Table E-17 lists these model-specific MCA error codes. Error code details are specified in MC4\_STATUS [31:16] (see Section E.5.3), the "Model Specific Error Code" field. The information in the "Other\_Info" field (MC4\_STATUS[56:32]) is common to the three processor error types and contains a correctable event count and specifies the MC4\_MISC register format.

## INTERPRETING MACHINE-CHECK ERROR CODES

Table E-17. Incremental MCA Error Code for Intel Xeon Processor MP 7100

| Processor MCA_Error_Code (MC4_STATUS[15:0]) |                            |                     |                                                                                         |
|---------------------------------------------|----------------------------|---------------------|-----------------------------------------------------------------------------------------|
| Type                                        | Error Code                 | Binary Encoding     | Meaning                                                                                 |
| C                                           | Internal Error             | 0000 0100 0000 0000 | Internal Error Type Code                                                                |
| A                                           | L3 Tag Error               | 0000 0001 0000 1011 | L3 Tag Error Type Code                                                                  |
| B                                           | Bus and Interconnect Error | 0000 100x 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |
|                                             |                            | 0000 101x 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |
|                                             |                            | 0000 110x 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |
|                                             |                            | 0000 1110 0000 1111 | Bus and Interconnection Error Type Code                                                 |
|                                             |                            | 0000 1111 0000 1111 | Not used but this encoding is reserved for compatibility with other MCA implementations |

The **Bold faced** binary encodings are the only encodings used by the processor for MC4\_STATUS[15:0].

### E.5.2 Other\_Info Field (all MCA Error Types)

The MC4\_STATUS[56:32] field is common to the processor's three MCA error types (A, B & C):

Table E-18. Other Information Field Bit Definition

| Bit Field Name | Bits                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39:32          | 8-bit<br>Correctable Event Count | Holds a count of the number of correctable events since cold reset. This is a saturating counter; the counter begins at 1 (with the first error) and saturates at a count of 255.                                                                                                                                                                                                                                                                                                                              |
| 41:40          | MC4_MISC format type             | The value in this field specifies the format of information in the MC4_MISC register. Currently, only two values are defined. Valid only when MISCV is asserted.                                                                                                                                                                                                                                                                                                                                               |
| 43:42          | -                                | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 51:44          | ECC syndrome                     | ECC syndrome value for a correctable ECC event when the "Valid ECC syndrome" bit is asserted                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 52             | Valid ECC syndrome               | Set when correctable ECC event supplies the ECC syndrome                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 54:53          | Threshold-Based Error Status     | <p>00: No tracking - No hardware status tracking is provided for the structure reporting this event.</p> <p>01: Green - Status tracking is provided for the structure posting the event; the current status is green (below threshold).</p> <p>10: Yellow - Status tracking is provided for the structure posting the event; the current status is yellow (above threshold).</p> <p>11: Reserved for future use</p> <p>Valid only if Valid bit (bit 63) is set<br/>Undefined if the UC bit (bit 61) is set</p> |
| 56:55          | -                                | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## INTERPRETING MACHINE-CHECK ERROR CODES

### E.5.3 Processor Model Specific Error Code Field

#### E.5.3.1 MCA Error Type A: L3 Error

Note: The Model Specific Error Code field in MC4\_STATUS (bits 31:16)

Table E-19. Type A: L3 Error Codes

| Bit Num | Sub-Field Name | Description                        | Legal Value(s)                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|----------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18:16   | L3 Error Code  | Describes the L3 error encountered | 000 - No error<br>001 - More than one way reporting a correctable event<br>010 - More than one way reporting an uncorrectable error<br>011 - More than one way reporting a tag hit<br>100 - No error<br>101 - One way reporting a correctable event<br>110 - One way reporting an uncorrectable error<br>111 - One or more ways reporting a correctable event while one or more ways are reporting an uncorrectable error |
| 20:19   | -              | Reserved                           | 00                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 31:21   | -              | Fixed pattern                      | 0010_0000_000                                                                                                                                                                                                                                                                                                                                                                                                             |

#### E.5.3.2 Processor Model Specific Error Code Field Type B: Bus and Interconnect Error

Note: The Model Specific Error Code field in MC4\_STATUS (bits 31:16)

Table E-20. Type B Bus and Interconnect Error Codes

| Bit Num | Sub-Field Name       | Description                                                            |
|---------|----------------------|------------------------------------------------------------------------|
| 16      | FSB Request Parity   | Parity error detected during FSB request phase                         |
| 17      | Core0 Addr Parity    | Parity error detected on Core 0 request's address field                |
| 18      | Core1 Addr Parity    | Parity error detected on Core 1 request's address field                |
| 19      |                      | Reserved                                                               |
| 20      | FSB Response Parity  | Parity error on FSB response field detected                            |
| 21      | FSB Data Parity      | FSB data parity error on inbound data detected                         |
| 22      | Core0 Data Parity    | Data parity error on data received from Core 0 detected                |
| 23      | Core1 Data Parity    | Data parity error on data received from Core 1 detected                |
| 24      | IDS Parity           | Detected an Enhanced Defer parity error (phase A or phase B)           |
| 25      | FSB Inbound Data ECC | Data ECC event to error on inbound data (correctable or uncorrectable) |
| 26      | FSB Data Glitch      | Pad logic detected a data strobe 'glitch' (or sequencing error)        |
| 27      | FSB Address Glitch   | Pad logic detected a request strobe 'glitch' (or sequencing error)     |
| 31:28   | ---                  | Reserved                                                               |

Exactly one of the bits defined in the preceding table will be set for a Bus and Interconnect Error. The Data ECC can be correctable or uncorrectable (the MC4\_STATUS.UC bit, of course, distinguishes between correctable and uncorrectable cases with the Other\_Info field possibly providing the ECC Syndrome for correctable errors). All other errors for this processor MCA Error Type are uncorrectable.

## INTERPRETING MACHINE-CHECK ERROR CODES

### E.5.3.3 Processor Model Specific Error Code Field Type C: Cache Bus Controller Error

Table E-21. Type C Cache Bus Controller Error Codes

| MC4_STATUS[31:16] (MSCE) Value | Error Description                                                                |
|--------------------------------|----------------------------------------------------------------------------------|
| 0000_0000_0000_0001 0x0001     | Inclusion Error from Core 0                                                      |
| 0000_0000_0000_0010 0x0002     | Inclusion Error from Core 1                                                      |
| 0000_0000_0000_0011 0x0003     | Write Exclusive Error from Core 0                                                |
| 0000_0000_0000_0100 0x0004     | Write Exclusive Error from Core 1                                                |
| 0000_0000_0000_0101 0x0005     | Inclusion Error from FSB                                                         |
| 0000_0000_0000_0110 0x0006     | SNP Stall Error from FSB                                                         |
| 0000_0000_0000_0111 0x0007     | Write Stall Error from FSB                                                       |
| 0000_0000_0000_1000 0x0008     | FSB Arb Timeout Error                                                            |
| 0000_0000_0000_1001 0x0009     | CBC OOD Queue Underflow/overflow                                                 |
| 0000_0001_0000_0000 0x0100     | Enhanced Intel SpeedStep Technology TM1-TM2 Error                                |
| 0000_0010_0000_0000 0x0200     | Internal Timeout error                                                           |
| 0000_0011_0000_0000 0x0300     | Internal Timeout Error                                                           |
| 0000_0100_0000_0000 0x0400     | Intel® Cache Safe Technology Queue Full Error or Disabled-ways-in-a-set overflow |
| 1100_0000_0000_0001 0xC001     | Correctable ECC event on outgoing FSB data                                       |
| 1100_0000_0000_0010 0xC002     | Correctable ECC event on outgoing Core 0 data                                    |
| 1100_0000_0000_0100 0xC004     | Correctable ECC event on outgoing Core 1 data                                    |
| 1110_0000_0000_0001 0xE001     | Uncorrectable ECC error on outgoing FSB data                                     |
| 1110_0000_0000_0010 0xE002     | Uncorrectable ECC error on outgoing Core 0 data                                  |
| 1110_0000_0000_0100 0xE004     | Uncorrectable ECC error on outgoing Core 1 data                                  |
| — all other encodings —        | Reserved                                                                         |

## INTERPRETING MACHINE-CHECK ERROR CODES

All errors - except for the correctable ECC types - in this table are uncorrectable. The correctable ECC events may supply the ECC syndrome in the Other\_Info field of the MC4\_STATUS MSR..

**Table E-22. Decoding Family OFH Machine Check Codes for Cache Hierarchy Errors**

| Type                                             | Bit No. | Bit Function        | Bit Description                                                                                                                                                                                                                               |

## INTERPRETING MACHINE-CHECK ERROR CODES

### NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

## APPENDIX F

### APIC BUS MESSAGE FORMATS

---

This appendix describes the message formats used when transmitting messages on the serial APIC bus. The information described here pertains only to the Pentium and P6 family processors.

#### F.1 BUS MESSAGE FORMATS

The local and I/O APICs transmit three types of messages on the serial APIC bus: EOI message, short message, and non-focused lowest priority message. The purpose of each type of message and its format are described below.

#### F.2 EOI MESSAGE

Local APICs send 14-cycle EOI messages to the I/O APIC to indicate that a level triggered interrupt has been accepted by the processor. This interrupt, in turn, is a result of software writing into the EOI register of the local APIC. Table F-1 shows the cycles in an EOI message.

Table F-1. EOI Message (14 Cycles)

| Cycle | Bit1   | Bit0 |                                 |
|-------|--------|------|---------------------------------|
| 1     | 1      | 1    | 11 = EOI                        |
| 2     | ArbID3 | 0    | Arbitration ID bits 3 through 0 |
| 3     | ArbID2 | 0    |                                 |
| 4     | ArbID1 | 0    |                                 |
| 5     | ArbID0 | 0    |                                 |
| 6     | V7     | V6   | Interrupt vector V7 - V0        |
| 7     | V5     | V4   |                                 |
| 8     | V3     | V2   |                                 |
| 9     | V1     | V0   |                                 |
| 10    | C      | C    | Checksum for cycles 6 - 9       |
| 11    | 0      | 0    |                                 |
| 12    | A      | A    | Status Cycle 0                  |
| 13    | A1     | A1   | Status Cycle 1                  |
| 14    | 0      | 0    | Idle                            |

## APIC BUS MESSAGE FORMATS

The checksum is computed for cycles 6 through 9. It is a cumulative sum of the 2-bit (Bit1:Bit0) logical data values. The carry out of all but the last addition is added to the sum. If any APIC computes a different checksum than the one appearing on the bus in cycle 10, it signals an error, driving 11 on the APIC bus during cycle 12. In this case, the APICs disregard the message. The sending APIC will receive an appropriate error indication (see Section 10.5.3, "Error Handling") and resend the message. The status cycles are defined in Table F-4.

### F.2.1 Short Message

Short messages (21-cycles) are used for sending fixed, NMI, SMI, INIT, start-up, ExtINT and lowest-priority-with-focus interrupts. Table F-2 shows the cycles in a short message.

Table F-2. Short Message (21 Cycles)

| Cycle | Bit1   | Bit0 |                                 |
|-------|--------|------|---------------------------------|
| 1     | 0      | 1    | 0 1 = normal                    |
| 2     | ArbID3 | 0    | Arbitration ID bits 3 through 0 |
| 3     | ArbID2 | 0    |                                 |
| 4     | ArbID1 | 0    |                                 |
| 5     | ArbID0 | 0    |                                 |
| 6     | DM     | M2   | DM = Destination Mode           |
| 7     | M1     | M0   | M2-M0 = Delivery mode           |
| 8     | L      | TM   | L = Level, TM = Trigger Mode    |
| 9     | V7     | V6   | V7-V0 = Interrupt Vector        |
| 10    | V5     | V4   |                                 |
| 11    | V3     | V2   |                                 |
| 12    | V1     | V0   |                                 |
| 13    | D7     | D6   | D7-D0 = Destination             |
| 14    | D5     | D4   |                                 |
| 15    | D3     | D2   |                                 |
| 16    | D1     | D0   |                                 |
| 17    | C      | C    | Checksum for cycles 6-16        |
| 18    | 0      | 0    |                                 |
| 19    | A      | A    | Status cycle 0                  |
| 20    | A1     | A1   | Status cycle 1                  |
| 21    | 0      | 0    | Idle                            |

If the physical delivery mode is being used, then cycles 15 and 16 represent the APIC ID and cycles 13 and 14 are considered don't care by the receiver. If the logical delivery mode is being used, then cycles 13 through 16 are the 8-bit logical destination field.

For shorthands of "all-incl-self" and "all-excl-self," the physical delivery mode and an arbitration priority of 15 (D0:D3 = 1111) are used. The agent sending the message is the only one required to distinguish between the two cases. It does so using internal information.

When using lowest priority delivery with an existing focus processor, the focus processor identifies itself by driving 10 during cycle 19 and accepts the interrupt. This is an indication to other APICs to terminate arbitration. If the focus processor has not been found, the short message is extended on-the-fly to the non-focused lowest-priority message. Note that except for the EOI message, messages generating a checksum or an acceptance error (see Section 10.5.3, "Error Handling") terminate after cycle 21.

## F.2.2 Non-focused Lowest Priority Message

These 34-cycle messages (see Table F-3) are used in the lowest priority delivery mode when a focus processor is not present. Cycles 1 through 20 are same as for the short message. If during the status cycle (cycle 19) the state of the (A:A) flags is 10B, a focus processor has been identified, and the short message format is used (see Table F-2). If the (A:A) flags are set to 00B, lowest priority arbitration is started and the 34-cycles of the non-focused lowest priority message are competed. For other combinations of status flags, refer to Section F.2.3, "APIC Bus Status Cycles."

Table F-3. Non-Focused Lowest Priority Message (34 Cycles)

| Cycle | Bit0   | Bit1 |                                 |
|-------|--------|------|---------------------------------|
| 1     | 0      | 1    | 0 1 = normal                    |
| 2     | ArbID3 | 0    | Arbitration ID bits 3 through 0 |
| 3     | ArbID2 | 0    |                                 |
| 4     | ArbID1 | 0    |                                 |
| 5     | ArbID0 | 0    |                                 |
| 6     | DM     | M2   | DM = Destination mode           |
| 7     | M1     | M0   | M2-M0 = Delivery mode           |
| 8     | L      | TM   | L = Level, TM = Trigger Mode    |
| 9     | V7     | V6   | V7-V0 = Interrupt Vector        |
| 10    | V5     | V4   |                                 |
| 11    | V3     | V2   |                                 |
| 12    | V1     | V0   |                                 |

## APIC BUS MESSAGE FORMATS

**Table F-3. Non-Focused Lowest Priority Message (34 Cycles) (Contd.)**

| Cycle | Bit0   | Bit1 |                                       |
|-------|--------|------|---------------------------------------|
| 13    | D7     | D6   | D7-D0 = Destination                   |
| 14    | D5     | D4   |                                       |
| 15    | D3     | D2   |                                       |
| 16    | D1     | D0   |                                       |
| 17    | C      | C    | Checksum for cycles 6-16              |
| 18    | 0      | 0    |                                       |
| 19    | A      | A    | Status cycle 0                        |
| 20    | A1     | A1   | Status cycle 1                        |
| 21    | P7     | 0    | P7 - P0 = Inverted Processor Priority |
| 22    | P6     | 0    |                                       |
| 23    | P5     | 0    |                                       |
| 24    | P4     | 0    |                                       |
| 25    | P3     | 0    |                                       |
| 26    | P2     | 0    |                                       |
| 27    | P1     | 0    |                                       |
| 28    | P0     | 0    |                                       |
| 29    | ArbID3 | 0    | Arbitration ID 3 -0                   |
| 30    | ArbID2 | 0    |                                       |
| 31    | ArbID1 | 0    |                                       |
| 32    | ArbID0 | 0    |                                       |
| 33    | A2     | A2   | Status Cycle                          |
| 34    | 0      | 0    | Idle                                  |

Cycles 21 through 28 are used to arbitrate for the lowest priority processor. The processors participating in the arbitration drive their inverted processor priority on the bus. Only the local APICs having free interrupt slots participate in the lowest priority arbitration. If no such APIC exists, the message will be rejected, requiring it to be tried at a later time.

Cycles 29 through 32 are also used for arbitration in case two or more processors have the same lowest priority. In the lowest priority delivery mode, all combinations of errors in cycle 33 (A2 A2) will set the "accept error" bit in the error status register (see Figure 10-9). Arbitration priority update is performed in cycle 20, and is not affected by errors detected in cycle 33. Only the local APIC that wins in the lowest

priority arbitration, drives cycle 33. An error in cycle 33 will force the sender to resend the message.

### F.2.3 APIC Bus Status Cycles

Certain cycles within an APIC bus message are status cycles. During these cycles the status flags (A:A) and (A1:A1) are examined. Table F-4 shows how these status flags are interpreted, depending on the current delivery mode and existence of a focus processor.

Table F-4. APIC Bus Status Cycles Interpretation

| Delivery Mode                    | A Status     | A1 Status        | A2 Status | Update ArbID and Cycle# | Message Length | Retry |
|----------------------------------|--------------|------------------|-----------|-------------------------|----------------|-------|
| EOI                              | 00: CS_OK    | 10: Accept       | XX:       | Yes, 13                 | 14 Cycle       | No    |
|                                  | 00: CS_OK    | 11: Retry        | XX:       | Yes, 13                 | 14 Cycle       | Yes   |
|                                  | 00: CS_OK    | 0X: Accept Error | XX:       | No                      | 14 Cycle       | Yes   |
|                                  | 11: CS_Error | XX:              | XX:       | No                      | 14 Cycle       | Yes   |
|                                  | 10: Error    | XX:              | XX:       | No                      | 14 Cycle       | Yes   |
|                                  | 01: Error    | XX:              | XX:       | No                      | 14 Cycle       | Yes   |
| Fixed                            | 00: CS_OK    | 10: Accept       | XX:       | Yes, 20                 | 21 Cycle       | No    |
|                                  | 00: CS_OK    | 11: Retry        | XX:       | Yes, 20                 | 21 Cycle       | Yes   |
|                                  | 00: CS_OK    | 0X: Accept Error | XX:       | No                      | 21 Cycle       | Yes   |
|                                  | 11: CS_Error | XX:              | XX:       | No                      | 21 Cycle       | Yes   |
|                                  | 10: Error    | XX:              | XX:       | No                      | 21 Cycle       | Yes   |
|                                  | 01: Error    | XX:              | XX:       | No                      | 21 Cycle       | Yes   |
| NMI, SMI, INIT, ExtINT, Start-Up | 00: CS_OK    | 10: Accept       | XX:       | Yes, 20                 | 21 Cycle       | No    |
|                                  | 00: CS_OK    | 11: Retry        | XX:       | Yes, 20                 | 21 Cycle       | Yes   |
|                                  | 00: CS_OK    | 0X: Accept Error | XX:       | No                      | 21 Cycle       | Yes   |
|                                  | 11: CS_Error | XX:              | XX:       | No                      | 21 Cycle       | Yes   |
|                                  | 10: Error    | XX:              | XX:       | No                      | 21 Cycle       | Yes   |
|                                  | 01: Error    | XX:              | XX:       | No                      | 21 Cycle       | Yes   |

## APIC BUS MESSAGE FORMATS

**Table F-4. APIC Bus Status Cycles Interpretation (Contd.)**

| Delivery Mode | A Status           | A1 Status         | A2 Status  | Update ArbID and Cycle# | Message Length | Retry |
|---------------|--------------------|-------------------|------------|-------------------------|----------------|-------|
| Lowest        | 00: CS_OK, NoFocus | 11: Do Lowest     | 10: Accept | Yes, 20                 | 34 Cycle       | No    |
|               | 00: CS_OK, NoFocus | 11: Do Lowest     | 11: Error  | Yes, 20                 | 34 Cycle       | Yes   |
|               | 00: CS_OK, NoFocus | 11: Do Lowest     | 0X: Error  | Yes, 20                 | 34 Cycle       | Yes   |
|               | 00: CS_OK, NoFocus | 10: End and Retry | XX:        | Yes, 20                 | 34 Cycle       | Yes   |
|               | 00: CS_OK, NoFocus | 0X: Error         | XX:        | No                      | 34 Cycle       | Yes   |
|               | 10: CS_OK, Focus   | XX:               | XX:        | Yes, 20                 | 34 Cycle       | No    |
|               | 11: CS_Error       | XX:               | XX:        | No                      | 21 Cycle       | Yes   |
|               | 01: Error          | XX:               | XX:        | No                      | 21 Cycle       | Yes   |

## APPENDIX G

# VMX CAPABILITY REPORTING FACILITY

---

The ability of a processor to support VMX operation and related instructions is indicated by CPUID.1:ECX.VMX[bit 5] = 1. A value 1 in this bit indicates support for VMX features.

Support for specific features detailed in Chapter 21 and other VMX chapters is determined by reading values from a set of capability MSRs. These MSRs are indexed starting at MSR address 480H. VMX capability MSRs are read-only; an attempt to write them (with WRMSR) produces a general-protection exception (#GP(0)). They do not exist on processors that do not support VMX operation; an attempt to read them (with RDMSR) on such processors produces a general-protection exception (#GP(0)).

### G.1 BASIC VMX INFORMATION

The IA32\_VMX\_BASIC MSR (index 480H) consists of the following fields:

- Bits 31:0 contain the 32-bit VMCS revision identifier used by the processor. Logical processors that use the same VMCS revision identifier use the same size for VMCS regions (see next item)
- Bits 44:32 report the number of bytes that software should allocate for the VMXON region and any VMCS region. It is a value greater than 0 and at most 4096 (bit 44 is set if and only if bits 43:32 are clear).
- Bit 48 indicates the width of the physical addresses that may be used for the VMXON region, each VMCS, and data structures referenced by pointers in a VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions). If the bit is 0, these addresses are limited to the processor's physical-address width.<sup>1</sup> If the bit is 1, these addresses are limited to 32 bits. This bit is always 0 for processors that support Intel 64 architecture.
- If bit 49 is read as 1, the logical processor supports the dual-monitor treatment of system-management interrupts and system-management mode. See Section 26.15 for details of this treatment.
- Bits 53:50 report the memory type that the logical processor uses to access the VMCS for VMREAD and VMWRITE and to access the VMCS, data structures referenced by pointers in the VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions), and the MSEG header during VM entries, VM exits, and in VMX non-root operation.<sup>2</sup>

---

1. On processors that support Intel 64 architecture, the pointer must not set bits beyond the processor's physical address width.

## VMX CAPABILITY REPORTING FACILITY

The first processors to support VMX operation use the write-back type. The values used are given in Table G-1.

**Table G-1. Memory Types Used For VMCS Access**

| Value(s) | Field            |
|----------|------------------|
| 0        | Uncacheable (UC) |
| 1-5      | Not used         |
| 6        | Write Back (WB)  |
| 7-15     | Not used         |

If software needs to access these data structures (e.g., to modify the contents of the MSR bitmaps), it can configure the paging structures to map them into the linear-address space. If it does so, it should establish mappings that use the memory type reported in this MSR.<sup>1</sup>

- If bit 54 is read as 1, the logical processor reports information in the VM-exit instruction-information field on VM exits due to execution of the INS and OUTS instructions. This reporting is done only if this bit is read as 1.
- Bit 55 is read as 1 if any VMX controls that default to 1 may be cleared to 0. See Appendix G.2 for details. It also reports support for the VMX capability MSRs IA32\_VMX\_TRUE\_PINBASED\_CTLs, IA32\_VMX\_TRUE\_PROCBASED\_CTLs, IA32\_VMX\_TRUE\_EXIT\_CTLs, and IA32\_VMX\_TRUE\_ENTRY\_CTLs. See Appendix G.3.1, Appendix G.3.2, Appendix G.4, and Appendix G.5 for details.
- The values of bits 47:45 and bits 63:56 are reserved and are read as 0.

## G.2 RESERVED CONTROLS AND DEFAULT SETTINGS

As noted in Chapter 21, “Virtual-Machine Control Structures”, certain VMX controls are reserved and must be set to a specific value (0 or 1) determined by the processor. The specific value to which a reserved control must be set is its **default setting**.

2. If the MTRRs are disabled by clearing the E bit (bit 11) in the IA32\_MTRR\_DEF\_TYPE MSR, the logical processor uses the UC memory type to access the indicated data structures, regardless of the value reported in bits 53:50 in the IA32\_VMX\_BASIC MSR. The processor will also use the UC memory type if the setting of CRO.CD on this logical processor (or another logical processor on the same physical processor) would cause it to do so for all memory accesses. The values of IA32\_MTRR\_DEF\_TYPE.E and CRO.CD do not affect the value reported in IA32\_VMX\_BASIC[53:50].
1. Alternatively, software may map any of these regions or structures with the UC memory type. (This may be necessary for the MSEG header.) Doing so is discouraged unless necessary as it will cause the performance of software accesses to those structures to suffer. The processor will continue to use the memory type reported in the VMX capability MSR IA32\_VMX\_BASIC with the exceptions noted.

Software can discover the default setting of a reserved control by consulting the appropriate VMX capability MSR (see Appendix G.3 through Appendix G.5).

Future processors may define new functionality for one or more reserved controls. Such processors would allow each newly defined control to be set either to 0 or to 1. Software that does not desire a control's new functionality should set the control to its default setting. For that reason, it is useful for software to know the default settings of the reserved controls.

Default settings partition the various controls into the following classes:

- **Always-flexible.** These have never been reserved.
- **Default0.** These are (or have been) reserved with a default setting of 0.
- **Default1.** They are (or have been) reserved with a default setting of 1.

As noted in Appendix G.1, a logical processor uses bit 55 of the IA32\_VMX\_BASIC MSR to indicate whether any of the default1 controls may be 0:

- If bit 55 of the IA32\_VMX\_BASIC MSR is read as 0, all the default1 controls are reserved and must be 1. VM entry will fail if any of these controls are 1 (see Section 23.2.1).
- If bit 55 of the IA32\_VMX\_BASIC MSR is read as 1, not all the default1 controls are reserved, and some (but not necessarily all) may be 0. The CPU supports four (4) new VMX capability MSRs: IA32\_VMX\_TRUE\_PINBASED\_CTLs, IA32\_VMX\_TRUE\_PROCBASED\_CTLs, IA32\_VMX\_TRUE\_EXIT\_CTLs, and IA32\_VMX\_TRUE\_ENTRY\_CTLs. See Appendix G.3 through Appendix G.5 for details. (These MSRs are not supported if bit 55 of the IA32\_VMX\_BASIC MSR is read as 0.)

See Section 27.5.1 for recommended software algorithms for proper capability detection of the default1 controls.

## G.3 VM-EXECUTION CONTROLS

There are separate capability MSRs for the pin-based VM-execution controls, the primary processor-based VM-execution controls, and the secondary processor-based VM-execution controls. These are described in Appendix G.3.1, Appendix G.3.2, and Appendix G.3.3, respectively.

### G.3.1 Pin-Based VM-Execution Controls

The IA32\_VMX\_PINBASED\_CTLs MSR (index 481H) reports on the allowed settings of **most** of the pin-based VM-execution controls (see Section 21.6.1):

- Bits 31:0 indicate the **allowed 0-settings** of these controls. VM entry allows control X (bit X of the pin-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

## VMX CAPABILITY REPORTING FACILITY

Exceptions are made for the pin-based VM-execution controls in the default1 class (see Appendix G.2). These are bits 1, 2, and 4; the corresponding bits of the IA32\_VMX\_PINBASED\_CTLs MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any pin-based VM-execution control in the default1 class is 0.
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PINBASED\_CTLs MSR (see below) reports which of the pin-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the **allowed 1-settings** of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PINBASED\_CTLs MSR (index 48DH) reports on the allowed settings of **all** of the pin-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the pin-based VM-execution controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32\_VMX\_PINBASED\_CTLs MSR. (The IA32\_VMX\_TRUE\_PINBASED\_CTLs MSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32\_VMX\_TRUE\_PINBASED\_CTLs MSR. Assuming that software knows that the default1 class of pin-based VM-execution controls contains bits 1, 2, and 4, there is no need for software to consult the IA32\_VMX\_PINBASED\_CTLs MSR.

### G.3.2 Primary Processor-Based VM-Execution Controls

The IA32\_VMX\_PROCBASED\_CTLs MSR (index 482H) reports on the allowed settings of **most** of the primary processor-based VM-execution controls (see Section 21.6.2):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the primary processor-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the primary processor-based VM-execution controls in the default1 class (see Appendix G.2). These are bits 1, 4–6, 8, 13–16, and 26; the corresponding bits of the IA32\_VMX\_PROCBASED\_CTLs MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any of the primary processor-based VM-execution controls in the default1 class is 0.
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PROCBASED\_CTLs MSR (see below) reports which of the primary processor-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PROCBASED\_CTLs MSR (index 48EH) reports on the allowed settings of **all** of the primary processor-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the primary processor-based VM-execution controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the primary processor-based VM-execution controls is contained in the IA32\_VMX\_PROCBASED\_CTLs MSR. (The IA32\_VMX\_TRUE\_PROCBASED\_CTLs MSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the processor-based VM-execution controls is contained in the IA32\_VMX\_TRUE\_PROCBASED\_CTLs MSR. Assuming that software knows that the default1 class of processor-based VM-execution controls contains bits 1, 4–6, 8, 13–16, and 26, there is no need for software to consult the IA32\_VMX\_PROCBASED\_CTLs MSR.

### G.3.3 Secondary Processor-Based VM-Execution Controls

The IA32\_VMX\_PROCBASED\_CTLs2 MSR (index 48BH) reports on the allowed settings of the secondary processor-based VM-execution controls (see Section 21.6.2). VM entries perform the following checks:

## VMX CAPABILITY REPORTING FACILITY

- Bits 31:0 indicate the allowed 0-settings of these controls. These bits are always 0. This fact indicates that VM entry allows each bit of the secondary processor-based VM-execution controls to be 0.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X (bit X of the secondary processor-based VM-execution controls) to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X and the “activate secondary controls” primary processor-based VM-execution control are both 1.

The IA32\_VMX\_PROCBASED\_CTL2 MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTL2 MSR is 1).

## G.4 VM-EXIT CONTROLS

The IA32\_VMX\_EXIT\_CTL2 MSR (index 483H) reports on the allowed settings of **most** of the VM-exit controls (see Section 21.7.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-exit controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.
- Exceptions are made for the VM-exit controls in the default1 class (see Appendix G.2). These are bits 0–8, 10, 11, 13, 14, 16, and 17; the corresponding bits of the IA32\_VMX\_EXIT\_CTL2 MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any VM-exit control in the default1 class is 0.
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_EXIT\_CTL2 MSR (see below) reports which of the VM-exit controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_EXIT\_CTL2 MSR (index 48FH) reports on the allowed settings of **all** of the VM-exit controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-exit controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the VM-exit controls is contained in the IA32\_VMX\_EXIT\_CTLs MSR. (The IA32\_VMX\_TRUE\_EXIT\_CTLs MSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the VM-exit controls is contained in the IA32\_VMX\_TRUE\_EXIT\_CTLs MSR. Assuming that software knows that the default1 class of VM-exit controls contains bits 0-8, 10, 11, 13, 14, 16, and 17, there is no need for software to consult the IA32\_VMX\_EXIT\_CTLs MSR.

## G.5 VM-ENTRY CONTROLS

The IA32\_VMX\_ENTRY\_CTLs MSR (index 484H) reports on the allowed settings of **most** of the VM-entry controls (see Section 21.8.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-entry controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. Exceptions are made for the VM-entry controls in the default1 class (see Appendix G.2). These are bits 0-8 and 12; the corresponding bits of the IA32\_VMX\_ENTRY\_CTLs MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any VM-entry control in the default1 class is 0.
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_ENTRY\_CTLs MSR (see below) reports which of the VM-entry controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry fails if bit X is 1 in the VM-entry controls and bit 32+X is 0 in this MSR.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_ENTRY\_CTLs MSR (index 490H) reports on the allowed settings of **all** of the VM-entry controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-entry controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the VM-entry controls is contained in the

## VMX CAPABILITY REPORTING FACILITY

IA32\_VMX\_ENTRY\_CTLs MSR. (The IA32\_VMX\_TRUE\_ENTRY\_CTLs MSR is not supported.)

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the VM-entry controls is contained in the IA32\_VMX\_TRUE\_ENTRY\_CTLs MSR. Assuming that software knows that the default1 class of VM-entry controls contains bits 0-8 and 12, there is no need for software to consult the IA32\_VMX\_ENTRY\_CTLs MSR.

## 6.6 MISCELLANEOUS DATA

The IA32\_VMX\_MISC MSR (index 485H) consists of the following fields:

- Bits 4:0 report a value X that specifies the relationship between the rate of the VMX-preemption timer and that of the timestamp counter (TSC). Specifically, the VMX-preemption timer (if it is active) counts down by 1 every time bit X in the TSC changes due to a TSC increment.
- If bit 5 is read as 1, VM exits store the value of IA32\_EFER.LMA into the “IA-32e mode guest” VM-entry control; see Section 24.2 for more details. This bit is read as 1 on any logical processor that supports the 1-setting of the “unrestricted guest” VM-execution control.
- Bits 8:6 report, as a bitmap, the activity states supported by the implementation:
  - Bit 6 reports (if set) the support for activity state 1 (HLT).
  - Bit 7 reports (if set) the support for activity state 2 (shutdown).
  - Bit 8 reports (if set) the support for activity state 3 (wait-for-SIPI).If an activity state is not supported, the implementation causes a VM entry to fail if it attempts to establish that activity state. All implementations support VM entry to activity state 0 (active).
- Bits 24:16 indicate the number of CR3-target values supported by the processor. This number is a value between 0 and 256, inclusive (bit 24 is set if and only if bits 23:16 are clear).
- Bits 27:25 is used to compute the recommended maximum number of MSRs that should appear in the VM-exit MSR-store list, the VM-exit MSR-load list, or the VM-entry MSR-load list. Specifically, if the value bits 27:25 of IA32\_VMX\_MISC is N, then  $512 * (N + 1)$  is the recommended maximum number of MSRs to be included in each list. If the limit is exceeded, undefined processor behavior may result (including a machine check during the VMX transition).
- If bit 28 is read as 1, bit 2 of the IA32\_SMM\_MONITOR\_CTL can be set to 1. VMXOFF unblocks SMIs unless IA32\_SMM\_MONITOR\_CTL[bit 2] is 1 (see Section 26.14.4).
- Bits 63:32 report the 32-bit MSEG revision identifier used by the processor.
- Bits 15:9 and bits 31:29 are reserved and are read as 0.

## G.7 VMX-FIXED BITS IN CRO

The IA32\_VMX\_CRO\_FIXED0 MSR (index 486H) and IA32\_VMX\_CRO\_FIXED1 MSR (index 487H) indicate how bits in CRO may be set in VMX operation. They report on bits in CRO that are allowed to be 0 and to be 1, respectively, in VMX operation. If bit X is 1 in IA32\_VMX\_CRO\_FIXED0, then that bit of CRO is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32\_VMX\_CRO\_FIXED1, then that bit of CRO is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32\_VMX\_CRO\_FIXED0, then that bit is also 1 in IA32\_VMX\_CRO\_FIXED1; if bit X is 0 in IA32\_VMX\_CRO\_FIXED1, then that bit is also 0 in IA32\_VMX\_CRO\_FIXED0. Thus, each bit in CRO is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32\_VMX\_CRO\_FIXED0 and 1 in IA32\_VMX\_CRO\_FIXED1).

## G.8 VMX-FIXED BITS IN CR4

The IA32\_VMX\_CR4\_FIXED0 MSR (index 488H) and IA32\_VMX\_CR4\_FIXED1 MSR (index 489H) indicate how bits in CR4 may be set in VMX operation. They report on bits in CR4 that are allowed to be 0 and 1, respectively, in VMX operation. If bit X is 1 in IA32\_VMX\_CR4\_FIXED0, then that bit of CR4 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32\_VMX\_CR4\_FIXED1, then that bit of CR4 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32\_VMX\_CR4\_FIXED0, then that bit is also 1 in IA32\_VMX\_CR4\_FIXED1; if bit X is 0 in IA32\_VMX\_CR4\_FIXED1, then that bit is also 0 in IA32\_VMX\_CR4\_FIXED0. Thus, each bit in CR4 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32\_VMX\_CR4\_FIXED0 and 1 in IA32\_VMX\_CR4\_FIXED1).

## G.9 VMCS ENUMERATION

The IA32\_VMX\_VMCS\_ENUM MSR (index 48AH) provides information to assist software in enumerating fields in the VMCS.

As noted in Section 21.10.2, each field in the VMCS is associated with a 32-bit encoding which is structured as follows:

- Bits 31:15 are reserved (must be 0).
- Bits 14:13 indicate the field's width.
- Bit 12 is reserved (must be 0).
- Bits 11:10 indicate the field's type.
- Bits 9:1 is an index field that distinguishes different fields with the same width and type.
- Bit 0 indicates access type.

IA32\_VMX\_VMCS\_ENUM indicates to software the highest index value used in the encoding of any field supported by the processor:

## VMX CAPABILITY REPORTING FACILITY

- Bits 9:1 contain the highest index value used for any VMCS encoding.
- Bit 0 and bits 63:10 are reserved and are read as 0.

## G.10 VPID AND EPT CAPABILITIES

The IA32\_VMX\_EPT\_VPID\_CAP MSR (index 48CH) reports information about the capabilities of the logical processor with regard to virtual-processor identifiers (VPIDs, Section 25.1) and extended page tables (EPT, Section 25.2):

- If bit 0 is read as 1, the logical processor allows software to configure EPT paging-structure entries in which bits 2:0 have value 100b (indicating an execute-only translation).
- Bit 6 indicates support for a page-walk length of 4.
- If bit 8 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be uncacheable (UC); see Section 21.6.11.
- If bit 14 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be write-back (WB).
- If bit 16 is read as 1, the logical processor allows software to configure a EPT PDE to map a 2-Mbyte page (by setting bit 7 in the EPT PDE).
- If bit 17 is read as 1, the logical processor allows software to configure a EPT PDPTE to map a 1-Gbyte page (by setting bit 7 in the EPT PDPTE).
- Support for the INVEPT instruction (see Chapter 6 of the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* and Section 25.3.3.1).
  - If bit 20 is read as 1, the INVEPT instruction is supported.
  - If bit 25 is read as 1, the single-context INVEPT type is supported.
  - If bit 26 is read as 1, the all-context INVEPT type is supported.
- Support for the INVVPID instruction (see Chapter 6 of the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* and Section 25.3.3.1).
  - If bit 32 is read as 1, the INVVPID instruction is supported.
  - If bit 40 is read as 1, the individual-address INVVPID type is supported.
  - If bit 41 is read as 1, the single-context INVVPID type is supported.
  - If bit 42 is read as 1, the all-context INVVPID type is supported.
  - If bit 43 is read as 1, the single-context-retaining-globals INVVPID type is supported.
- Bits 5:1, bit 7, bits 13:9, bit 15, bits 19:17, bits 24:21, bits 31:27, bits 39:33, and bits 63:44 are reserved and are read as 0.

The IA32\_VMX\_EPT\_VPID\_CAP MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTLs MSR is 1) and that support either the 1-setting of the

## VMX CAPABILITY REPORTING FACILITY

“enable EPT” VM-execution control (only if bit 33 of the IA32\_VMX\_PROCBASED\_CTL2 MSR is 1) or the 1-setting of the “enable VPID” VM-execution control (only if bit 37 of the IA32\_VMX\_PROCBASED\_CTL2 MSR is 1).

VMX CAPABILITY REPORTING FACILITY

## APPENDIX H FIELD ENCODING IN VMCS

---

Every component of the VMCS is encoded by a 32-bit field that can be used by VMREAD and VMWRITE. Section 21.10.2 describes the structure of the encoding space (the meanings of the bits in each 32-bit encoding).

This appendix enumerates all fields in the VMCS and their encodings. Fields are grouped by width (16-bit, 32-bit, etc.) and type (guest-state, host-state, etc.)

### H.1 16-BIT FIELDS

A value of 0 in bits 14:13 of an encoding indicates a 16-bit field. Only guest-state areas and the host-state area contain 16-bit fields. As noted in Section 21.10.2, each 16-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

#### H.1.1 16-Bit Control Field

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. There is only one such 16-bit field as given in Table H-1.

Table H-1. Encoding for 16-Bit Control Fields (0000\_00xx\_xxxx\_xxx0B)

| Field Name                                       | Index      | Encoding  |
|--------------------------------------------------|------------|-----------|
| Virtual-processor identifier (VPID) <sup>1</sup> | 000000000B | 00000000H |

NOTES:

1. This field exists only on processors that support the 1-setting of the “enable VPID” VM-execution control.

#### H.1.2 16-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-2 enumerates 16-bit guest-state fields.

Table H-2. Encodings for 16-Bit Guest-State Fields (0000\_10xx\_xxxx\_xxx0B)

| Field Name        | Index      | Encoding  |
|-------------------|------------|-----------|
| Guest ES selector | 000000000B | 00000800H |

## FIELD ENCODING IN VMCS

**Table H-2. Encodings for 16-Bit Guest-State Fields (0000\_10xx\_xxxx\_xxx0B)**

| Field Name          | Index      | Encoding  |
|---------------------|------------|-----------|
| Guest CS selector   | 000000001B | 00000802H |
| Guest SS selector   | 000000010B | 00000804H |
| Guest DS selector   | 000000011B | 00000806H |
| Guest FS selector   | 000000100B | 00000808H |
| Guest GS selector   | 000000101B | 0000080AH |
| Guest LDTR selector | 000000110B | 0000080CH |
| Guest TR selector   | 000000111B | 0000080EH |

### H.1.3 16-Bit Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table H-3 enumerates the 16-bit host-state fields.

**Table H-3. Encodings for 16-Bit Host-State Fields (0000\_11xx\_xxxx\_xxx0B)**

| Field Name       | Index      | Encoding  |
|------------------|------------|-----------|
| Host ES selector | 000000000B | 00000C00H |
| Host CS selector | 000000001B | 00000C02H |
| Host SS selector | 000000010B | 00000C04H |
| Host DS selector | 000000011B | 00000C06H |
| Host FS selector | 000000100B | 00000C08H |
| Host GS selector | 000000101B | 00000C0AH |
| Host TR selector | 000000110B | 00000C0CH |

## H.2 64-BIT FIELDS

A value of 1 in bits 14:13 of an encoding indicates a 64-bit field. There are 64-bit fields only for controls and for guest state. As noted in Section 21.10.2, every 64-bit field has two encodings, which differ on bit 0, the access type. Thus, each such field has an even encoding for full access and an odd encoding for high access.

## H.2.1 64-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table H-4 enumerates the 64-bit control fields.

**Table H-4. Encodings for 64-Bit Control Fields (0010\_00xx\_xxxx\_xxxAb)**

| Field Name                                 | Index       | Encoding  |
|--------------------------------------------|-------------|-----------|
| Address of I/O bitmap A (full)             | 000000000B  | 00002000H |
| Address of I/O bitmap A (high)             | 000000000B  | 00002001H |

**NOTES:**

1. This field exists only on processors that support the 1-setting of the “use MSR bitmaps” VM-execution control.
2. This field exists only on processors that support either the 1-setting of the “use TPR shadow” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “virtualize APIC accesses” VM-execution control.

## FIELD ENCODING IN VMCS

4. This field exists only on processors that support the 1-setting of the "enable EPT" VM-execution control.

### H.2.2 64-Bit Read-Only Data Field

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. There is only one such 64-bit field as given in Table H-5. (As with other 64-bit fields, this one has two encodings.)

**Table H-5. Encodings for 64-Bit Read-Only Data Field (0010\_01xx\_xxxx\_xxxAb)**

| Field Name                                 | Index      | Encoding  |
|--------------------------------------------|------------|-----------|
| Guest-physical address (full) <sup>1</sup> | 000000000B | 00002400H |
| Guest-physical address (high) <sup>1</sup> | 000000000B | 00002401H |

**NOTES:**

1. This field exists only on processors that support the 1-setting of the "enable EPT" VM-execution control.

### H.2.3 64-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-6 enumerates the 64-bit guest-state fields.

**Table H-6. Encodings for 64-Bit Guest-State Fields (0010\_10xx\_xxxx\_xxxAb)**

| Field Name                                      | Index      | Encoding  |
|-------------------------------------------------|------------|-----------|
| VMCS link pointer (full)                        | 000000000B | 00002800H |
| VMCS link pointer (high)                        | 000000000B | 00002801H |
| Guest IA32_DEBUGCTL (full)                      | 000000001B | 00002802H |
| Guest IA32_DEBUGCTL (high)                      | 000000001B | 00002803H |
| Guest IA32_PAT (full) <sup>1</sup>              | 000000010B | 00002804H |
| Guest IA32_PAT (high) <sup>1</sup>              | 000000010B | 00002805H |
| Guest IA32_EFER (full) <sup>2</sup>             | 000000011B | 00002806H |
| Guest IA32_EFER (high) <sup>2</sup>             | 000000011B | 00002807H |
| Guest IA32_PERF_GLOBAL_CTRL (full) <sup>3</sup> | 000000100B | 00002808H |
| Guest IA32_PERF_GLOBAL_CTRL (high) <sup>3</sup> | 000000100B | 00002809H |
| Guest PDPTEO (full) <sup>4</sup>                | 000000101B | 0000280AH |
| Guest PDPTEO (high) <sup>4</sup>                | 000000101B | 0000280BH |

**Table H-6. Encodings for 64-Bit Guest-State Fields (0010\_10xx\_xxxx\_xxxAb)**

| Field Name                       | Index      | Encoding  |
|----------------------------------|------------|-----------|
| Guest PDPTE1 (full) <sup>4</sup> | 000000110B | 0000280CH |
| Guest PDPTE1 (high) <sup>4</sup> | 000000110B | 0000280DH |
| Guest PDPTE2 (full) <sup>4</sup> | 000000111B | 0000280EH |
| Guest PDPTE2 (high) <sup>4</sup> | 000000111B | 0000280FH |
| Guest PDPTE3 (full) <sup>4</sup> | 000001000B | 00002810H |
| Guest PDPTE3 (high) <sup>4</sup> | 000001000B | 00002811H |

**NOTES:**

1. This field exists only on processors that support either the 1-setting of the "load IA32\_PAT" VM-entry control or that of the "save IA32\_PAT" VM-exit control.
2. This field exists only on processors that support either the 1-setting of the "load IA32\_EFER" VM-entry control or that of the "save IA32\_EFER" VM-exit control.
3. This field exists only on processors that support the 1-setting of the "load IA32\_PERF\_GLOBAL\_CTRL" VM-entry control.
4. This field exists only on processors that support the 1-setting of the "enable EPT" VM-execution control.

**H.2.4 64-Bit Host-State Fields**

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table H-7 enumerates the 64-bit control fields.

**Table H-7. Encodings for 64-Bit Host-State Fields (0010\_11xx\_xxxx\_xxxAb)**

| Field Name                                     | Index      | Encoding  |
|------------------------------------------------|------------|-----------|
| Host IA32_PAT (full) <sup>1</sup>              | 000000000B | 00002C00H |
| Host IA32_PAT (high) <sup>1</sup>              | 000000000B | 00002C01H |
| Host IA32_EFER (full) <sup>2</sup>             | 000000001B | 00002C02H |
| Host IA32_EFER (high) <sup>2</sup>             | 000000001B | 00002C03H |
| Host IA32_PERF_GLOBAL_CTRL (full) <sup>3</sup> | 000000010B | 00002C04H |
| Host IA32_PERF_GLOBAL_CTRL (high) <sup>3</sup> | 000000010B | 00002C05H |

**NOTES:**

1. This field exists only on processors that support the 1-setting of the "load IA32\_PAT" VM-exit control.
2. This field exists only on processors that support the 1-setting of the "load IA32\_EFER" VM-exit control.

## FIELD ENCODING IN VMCS

3. This field exists only on processors that support the 1-setting of the "load IA32\_PERF\_GLOBAL\_CTRL" VM-exit control.

## H.3 32-BIT FIELDS

A value of 2 in bits 14:13 of an encoding indicates a 32-bit field. As noted in Section 21.10.2, each 32-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

### H.3.1 32-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table H-8 enumerates the 32-bit control fields.

**Table H-8. Encodings for 32-Bit Control Fields (0100\_00xx\_xxxx\_xxx0B)**

| Field Name                                                   | Index       | Encoding  |
|--------------------------------------------------------------|-------------|-----------|
| Pin-based VM-execution controls                              | 000000000B  | 00004000H |
| Primary processor-based VM-execution controls                | 000000001B  | 00004002H |
| Exception bitmap                                             | 000000010B  | 00004004H |
| Page-fault error-code mask                                   | 000000011B  | 00004006H |
| Page-fault error-code match                                  | 0000000100B | 00004008H |
| CR3-target count                                             | 0000000101B | 0000400AH |
| VM-exit controls                                             | 0000000110B | 0000400CH |
| VM-exit MSR-store count                                      | 0000000111B | 0000400EH |
| VM-exit MSR-load count                                       | 0000001000B | 00004010H |
| VM-entry controls                                            | 000001001B  | 00004012H |
| VM-entry MSR-load count                                      | 000001010B  | 00004014H |
| VM-entry interruption-information field                      | 000001011B  | 00004016H |
| VM-entry exception error code                                | 000001100B  | 00004018H |
| VM-entry instruction length                                  | 000001101B  | 0000401AH |
| TPR threshold <sup>1</sup>                                   | 000001110B  | 0000401CH |
| Secondary processor-based VM-execution controls <sup>2</sup> | 000001111b  | 0000401EH |
| PLE_Gap <sup>3</sup>                                         | 000010000b  | 00004020H |
| PLE_Window <sup>3</sup>                                      | 000010001b  | 00004022H |

**NOTES:**

1. This field exists only on processors that support the 1-setting of the “use TPR shadow” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “PAUSE-loop exiting” VM-execution control.

### H.3.2 32-Bit Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table H-9 enumerates the 32-bit read-only data fields.

**Table H-9. Encodings for 32-Bit Read-Only Data Fields (0100\_01xx\_xxxx\_xxx0B)**

| Field Name                       | Index      | Encoding  |
|----------------------------------|------------|-----------|
| VM-instruction error             | 000000000B | 00004400H |
| Exit reason                      | 000000001B | 00004402H |
| VM-exit interruption information | 000000010B | 00004404H |
| VM-exit interruption error code  | 000000011B | 00004406H |
| IDT-vectoring information field  | 000000100B | 00004408H |
| IDT-vectoring error code         | 000000101B | 0000440AH |
| VM-exit instruction length       | 000000110B | 0000440CH |
| VM-exit instruction information  | 000000111B | 0000440EH |

### H.3.3 32-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-10 enumerates the 32-bit guest-state fields.

**Table H-10. Encodings for 32-Bit Guest-State Fields (0100\_10xx\_xxxx\_xxx0B)**

| Field Name     | Index      | Encoding  |
|----------------|------------|-----------|
| Guest ES limit | 000000000B | 00004800H |
| Guest CS limit | 000000001B | 00004802H |
| Guest SS limit | 000000010B | 00004804H |

## FIELD ENCODING IN VMCS

**Table H-10. Encodings for 32-Bit Guest-State Fields  
(0100\_10xx\_xxxx\_xxx0B) (Contd.)**

| Field Name                              | Index      | Encoding  |
|-----------------------------------------|------------|-----------|
| Guest DS limit                          | 000000011B | 00004806H |
| Guest FS limit                          | 000000100B | 00004808H |
| Guest GS limit                          | 000000101B | 0000480AH |
| Guest LDTR limit                        | 000000110B | 0000480CH |
| Guest TR limit                          | 000000111B | 0000480EH |
| Guest GDTR limit                        | 000001000B | 00004810H |
| Guest IDTR limit                        | 000001001B | 00004812H |
| Guest ES access rights                  | 000001010B | 00004814H |
| Guest CS access rights                  | 000001011B | 00004816H |
| Guest SS access rights                  | 000001100B | 00004818H |
| Guest DS access rights                  | 000001101B | 0000481AH |
| Guest FS access rights                  | 000001110B | 0000481CH |
| Guest GS access rights                  | 000001111B | 0000481EH |
| Guest LDTR access rights                | 000010000B | 00004820H |
| Guest TR access rights                  | 000010001B | 00004822H |
| Guest interruptibility state            | 000010010B | 00004824H |
| Guest activity state                    | 000010011B | 00004826H |
| Guest SMBASE                            | 000010100B | 00004828H |
| Guest IA32_SYSENTER_CS                  | 000010101B | 0000482AH |
| VMX-preemption timer value <sup>1</sup> | 000010111B | 0000482EH |

### NOTES:

1. This field exists only on processors that support the 1-setting of the "activate VMX-preemption timer" VM-execution control.

The limit fields for GDTR and IDTR are defined to be 32 bits in width even though these fields are only 16-bits wide in the Intel 64 and IA-32 architectures. VM entry ensures that the high 16 bits of both these fields are cleared to 0.

### H.3.4 32-Bit Host-State Field

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. There is only one such 32-bit field as given in Table H-11.

**Table H-11. Encoding for 32-Bit Host-State Field (0100\_11xx\_xxxx\_xxx0B)**

| Field Name            | Index      | Encoding  |
|-----------------------|------------|-----------|
| Host IA32_SYSENTER_CS | 000000000B | 00004C00H |

## H.4 NATURAL-WIDTH FIELDS

A value of 3 in bits 14:13 of an encoding indicates a natural-width field. As noted in Section 21.10.2, each of these fields allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

### H.4.1 Natural-Width Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table H-12 enumerates the natural-width control fields.

**Table H-12. Encodings for Natural-Width Control Fields (0110\_00xx\_xxxx\_xxx0B)**

| Field Name                      | Index      | Encoding  |
|---------------------------------|------------|-----------|
| CR0 guest/host mask             | 000000000B | 00006000H |
| CR4 guest/host mask             | 000000001B | 00006002H |
| CR0 read shadow                 | 000000010B | 00006004H |
| CR4 read shadow                 | 000000011B | 00006006H |
| CR3-target value 0              | 000000100B | 00006008H |
| CR3-target value 1              | 000000101B | 0000600AH |
| CR3-target value 2              | 000000110B | 0000600CH |
| CR3-target value 3 <sup>1</sup> | 000000111B | 0000600EH |

**NOTES:**

1. If a future implementation supports more than 4 CR3-target values, they will be encoded consecutively following the 4 encodings given here.

## FIELD ENCODING IN VMCS

### H.4.2 Natural-Width Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table H-13 enumerates the natural-width read-only data fields.

**Table H-13. Encodings for Natural-Width Read-Only Data Fields  
(0110\_01xx\_xxxx\_xxx0B)**

| Field Name           | Index      | Encoding  |
|----------------------|------------|-----------|
| Exit qualification   | 000000000B | 00006400H |
| I/O RCX              | 000000001B | 00006402H |
| I/O RSI              | 000000010B | 00006404H |
| I/O RDI              | 000000011B | 00006406H |
| I/O RIP              | 000000100B | 00006408H |
| Guest-linear address | 000000101B | 0000640AH |

### H.4.3 Natural-Width Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-14 enumerates the natural-width guest-state fields.

**Table H-14. Encodings for Natural-Width Guest-State Fields  
(0110\_10xx\_xxxx\_xxx0B)**

| Field Name      | Index      | Encoding  |
|-----------------|------------|-----------|
| Guest CRO       | 000000000B | 00006800H |
| Guest CR3       | 000000001B | 00006802H |
| Guest CR4       | 000000010B | 00006804H |
| Guest ES base   | 000000011B | 00006806H |
| Guest CS base   | 000000100B | 00006808H |
| Guest SS base   | 000000101B | 0000680AH |
| Guest DS base   | 000000110B | 0000680CH |
| Guest FS base   | 000000111B | 0000680EH |

| Guest LDTR base | 000001001B | 00006812H |
| Guest TR base   | 000001010B | 00006814H |
| Guest GDTR base | 000001011B | 00006816H |

**Table H-14. Encodings for Natural-Width Guest-State Fields  
(0110\_10xx\_xxxx\_xxx0B) (Contd.)**

| Field Name                     | Index      | Encoding  |
|--------------------------------|------------|-----------|
| Guest IDTR base                | 000001100B | 00006818H |
| Guest DR7                      | 000001101B | 0000681AH |
| Guest RSP                      | 000001110B | 0000681CH |
| Guest RIP                      | 000001111B | 0000681EH |
| Guest RFLAGS                   | 000010000B | 00006820H |
| Guest pending debug exceptions | 000010001B | 00006822H |
| Guest IA32_SYSENTER_ESP        | 000010010B | 00006824H |
| Guest IA32_SYSENTER_EIP        | 000010011B | 00006826H |

The base-address fields for ES, CS, SS, and DS in the guest-state area are defined to be natural-width (with 64 bits on processors supporting Intel 64 architecture) even though these fields are only 32-bits wide in the Intel 64 architecture. VM entry ensures that the high 32 bits of these fields are cleared to 0.

#### H.4.4 Natural-Width Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table H-15 enumerates the natural-width host-state fields.

**Table H-15. Encodings for Natural-Width Host-State Fields  
(0110\_11xx\_xxxx\_xxx0B)**

| Field Name             | Index       | Encoding  |
|------------------------|-------------|-----------|
| Host CRO               | 000000000B  | 00006C00H |
| Host CR3               | 000000001B  | 00006C02H |
| Host CR4               | 000000010B  | 00006C04H |
| Host FS base           | 000000011B  | 00006C06H |
| Host GS base           | 0000000100B | 00006C08H |
| Host TR base           | 0000000101B | 00006C0AH |
| Host GDTR base         | 0000000110B | 00006C0CH |
| Host IDTR base         | 0000000111B | 00006C0EH |
| Host IA32_SYSENTER_ESP | 000001000B  | 00006C10H |

| Host RSP               | 000001010B  | 00006C14H |

## FIELD ENCODING IN VMCS

**Table H-15. Encodings for Natural-Width Host-State Fields  
(0110\_11xx\_xxxx\_xxxOB) (Contd.)**

| Field Name | Index      | Encoding  |
|------------|------------|-----------|
| Host RIP   | 000001011B | 00006C16H |

## APPENDIX I

# VMX BASIC EXIT REASONS

---

Every VM exit writes a 32-bit exit reason to the VMCS (see Section 21.9.1). Certain VM-entry failures also do this (see Section 23.7). The low 16 bits of the exit-reason field form the basic exit reason which provides basic information about the cause of the VM exit or VM-entry failure.

Table I-1 lists values for basic exit reasons and explains their meaning. Entries apply to VM exits, unless otherwise noted.

Table I-1. Basic Exit Reasons

| Basic Exit Reason | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0                 | Exception or non-maskable interrupt (NMI). Either:<br>1: Guest software caused an exception and the bit in the exception bitmap associated with exception's vector was 1.<br>2: An NMI was delivered to the logical processor and the "NMI exiting" VM-execution control was 1. This case includes executions of BOUND that cause #BR, executions of INT3 (they cause #BP), executions of INTO that cause #OF, and executions of UD2 (they cause #UD). |
| 1                 | External interrupt. An external interrupt arrived and the "external-interrupt exiting" VM-execution control was 1.                                                                                                                                                                                                                                                                                                                                     |
| 2                 | Triple fault. The logical processor encountered an exception while attempting to call the double-fault handler and that exception did not itself cause a VM exit due to the exception bitmap.                                                                                                                                                                                                                                                          |
| 3                 | INIT signal. An INIT signal arrived                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4                 | Start-up IPI (SIPI). A SIPI arrived while the logical processor was in the "wait-for-SIPI" state.                                                                                                                                                                                                                                                                                                                                                      |
| 5                 | I/O system-management interrupt (SMI). An SMI arrived immediately after retirement of an I/O instruction and caused an SMM VM exit (see Section 26.15.2).                                                                                                                                                                                                                                                                                              |
| 6                 | Other SMI. An SMI arrived and caused an SMM VM exit (see Section 26.15.2) but not immediately after retirement of an I/O instruction.                                                                                                                                                                                                                                                                                                                  |
| 7                 | Interrupt window. At the beginning of an instruction, RFLAGS.IF was 1; events were not blocked by STI or by MOV SS; and the "interrupt-window exiting" VM-execution control was 1.                                                                                                                                                                                                                                                                     |
| 8                 | NMI window. At the beginning of an instruction, there was no virtual-NMI blocking; events were not blocked by MOV SS; and the "NMI-window exiting" VM-execution control was 1.                                                                                                                                                                                                                                                                         |
| 9                 | <b>Task switch.</b> Guest software attempted a task switch.                                                                                                                                                                                                                                                                                                                                                                                            |
| 10                | CPUID. Guest software attempted to execute CPUID.                                                                                                                                                                                                                                                                                                                                                                                                      |

## VMX BASIC EXIT REASONS

Table I-1. Basic Exit Reasons (Contd.)

| Basic Exit Reason | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11                | GETSEC. Guest software attempted to execute GETSEC.                                                                                                                                                                                                                                                                                                                                               |
| 12                | HLT. Guest software attempted to execute HLT and the “HLT exiting” VM-execution control was 1.                                                                                                                                                                                                                                                                                                    |
| 13                | INVD. Guest software attempted to execute INVD.                                                                                                                                                                                                                                                                                                                                                   |
| 14                | INVLPG. Guest software attempted to execute INVLPG and the “INVLPG exiting” VM-execution control was 1.                                                                                                                                                                                                                                                                                           |
| 15                | RDPMC. Guest software attempted to execute RDPMC and the “RDPMC exiting” VM-execution control was 1.                                                                                                                                                                                                                                                                                              |
| 16                | RDTSC. Guest software attempted to execute RDTSC and the “RDTSC exiting” VM-execution control was 1.                                                                                                                                                                                                                                                                                              |
| 17                | RSM. Guest software attempted to execute RSM in SMM.                                                                                                                                                                                                                                                                                                                                              |
| 18                | <b>VMCALL.</b> VMCALL was executed either by guest software (causing an ordinary VM exit) or by the executive monitor (causing an SMM VM exit; see Section 26.15.2).                                                                                                                                                                                                                              |
| 19                | VMCLEAR. Guest software attempted to execute VMCLEAR.                                                                                                                                                                                                                                                                                                                                             |
| 20                | VMLAUNCH. Guest software attempted to execute VMLAUNCH.                                                                                                                                                                                                                                                                                                                                           |
| 21                | VMPTRLD. Guest software attempted to execute VMPTRLD.                                                                                                                                                                                                                                                                                                                                             |
| 22                | VMPTRST. Guest software attempted to execute VMPTRST.                                                                                                                                                                                                                                                                                                                                             |
| 23                | VMREAD. Guest software attempted to execute VMREAD.                                                                                                                                                                                                                                                                                                                                               |
| 24                | VMRESUME. Guest software attempted to execute VMRESUME.                                                                                                                                                                                                                                                                                                                                           |
| 25                | VMWRITE. Guest software attempted to execute VMWRITE.                                                                                                                                                                                                                                                                                                                                             |
| 26                | <b>VMXOFF.</b> Guest software attempted to execute VMXOFF.                                                                                                                                                                                                                                                                                                                                        |
| 27                | <b>VMXON.</b> Guest software attempted to execute VMXON.                                                                                                                                                                                                                                                                                                                                          |
| 28                | <b>Control-register accesses.</b> Guest software attempted to access CRO, CR3, CR4, or CR8 using CLTS, LMSW, or MOV CR and the VM-execution control fields indicate that a VM exit should occur (see Section 22.1 for details). This basic exit reason is not used for trap-like VM exits following executions of the MOV to CR8 instruction when the “use TPR shadow” VM-execution control is 1. |
| 29                | MOV DR. Guest software attempted a MOV to or from a debug register and the “MOV-DR exiting” VM-execution control was 1.                                                                                                                                                                                                                                                                           |
| 30                | <b>I/O instruction.</b> Guest software attempted to execute an I/O instruction and either:<br>1: The “use I/O bitmaps” VM-execution control was 0 and the “unconditional I/O exiting” VM-execution control was 1.<br>2: The “use I/O bitmaps” VM-execution control was 1 and a bit in the I/O bitmap associated with one of the ports accessed by the I/O instruction was 1.                      |

Table I-1. Basic Exit Reasons (Contd.)

| Basic Exit Reason | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31                | <b>RDMSR.</b> Guest software attempted to execute RDMSR and either:<br>1: The “use MSR bitmaps” VM-execution control was 0.<br>2: The value of RCX is neither in the range 0000000H – 00001FFFF nor in the range C000000H – C0001FFFF.<br>3: The value of RCX was in the range 0000000H – 00001FFFF and the $n^{\text{th}}$ bit in read bitmap for low MSRs is 1, where $n$ was the value of RCX.<br>4: The value of RCX is in the range C000000H – C0001FFFF and the $n^{\text{th}}$ bit in read bitmap for high MSRs is 1, where $n$ is the value of RCX & 00001FFFH.   |
| 32                | <b>WRMSR.</b> Guest software attempted to execute WRMSR and either:<br>1: The “use MSR bitmaps” VM-execution control was 0.<br>2: The value of RCX is neither in the range 0000000H – 00001FFFF nor in the range C000000H – C0001FFFF.<br>3: The value of RCX was in the range 0000000H – 00001FFFF and the $n^{\text{th}}$ bit in write bitmap for low MSRs is 1, where $n$ was the value of RCX.<br>4: The value of RCX is in the range C000000H – C0001FFFF and the $n^{\text{th}}$ bit in write bitmap for high MSRs is 1, where $n$ is the value of RCX & 00001FFFH. |
| 33                | VM-entry failure due to invalid guest state. A VM entry failed one of the checks identified in Section 23.3.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 34                | VM-entry failure due to MSR loading. A VM entry failed in an attempt to load MSRs. See Section 23.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 36                | <b>MWAIT.</b> Guest software attempted to execute MWAIT and the “MWAIT exiting” VM-execution control was 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 37                | <b>Monitor trap flag.</b> A VM entry occurred due to the 1-setting of the “monitor trap flag” VM-execution control and injection of an MTF VM exit as part of VM entry. See Section 22.7.2.                                                                                                                                                                                                                                                                                                                                                                               |
| 39                | <b>MONITOR.</b> Guest software attempted to execute MONITOR and the “MONITOR exiting” VM-execution control was 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 40                | <b>PAUSE.</b> Either guest software attempted to execute PAUSE and the “PAUSE exiting” VM-execution control was 1 or the “PAUSE-loop exiting” VM-execution control was 1 and guest software executed a PAUSE loop with execution time exceeding PLE_Window (see Section 22.1.3).                                                                                                                                                                                                                                                                                          |
| 41                | <b>VM-entry failure due to machine check.</b> A machine check occurred during VM entry (see Section 23.8).                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 43                | <b>TPR below threshold.</b> The logical processor determined that the value of the TPR shadow was below that of the TPR threshold VM-execution control field while the “use TPR shadow” VM-execution control was 1 in one of the following cases: <ul style="list-style-type: none"><li>▪ After guest software executed MOV to CR8 (see Section 22.1.3).</li><li>▪ As part of a TPR-shadow update (see Section 22.5.3.3).</li><li>▪ After VM entry with the 1-setting of the “virtualize APIC accesses” VM-execution control (see Section 23.6.7).</li></ul>              |

## VMX BASIC EXIT REASONS

Table I-1. Basic Exit Reasons (Contd.)

| Basic Exit Reason | Description                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 44                | <b>APIC access.</b> Guest software attempted to access memory at a physical address on the APIC-access page and the “virtualize APIC accesses” VM-execution control was 1 (see Section 22.2). |
| 46                | <b>Access to GDTR or IDTR.</b> Guest software attempted to execute LGDT, LIDT, SGDT, or SIDT and the “descriptor-table exiting” VM-execution control was 1.                                   |
| 47                | <b>Access to LDTR or TR.</b> Guest software attempted to execute LLDT, LTR, SLDT, or STR and the “descriptor-table exiting” VM-execution control was 1.                                       |
| 48                | <b>EPT violation.</b> An attempt to access memory with a guest-physical address was disallowed by the configuration of the EPT paging structures.                                             |
| 49                | <b>EPT misconfiguration.</b> An attempt to access memory with a guest-physical address encountered a misconfigured EPT paging-structure entry.                                                |
| 50                | INVEPT. Guest software attempted to execute INVEPT.                                                                                                                                           |
| 51                | RDTSCP. Guest software attempted to execute RDTSCP and the “enable RDTSCP” and “RDTSC exiting” VM-execution controls were both 1.                                                             |
| 52                | VMX-preemption timer expired. The preemption timer counted down to zero.                                                                                                                      |
| 53                | INVPVID. Guest software attempted to execute INVPVID.                                                                                                                                         |
| 54                | WBINVD. Guest software attempted to execute WBINVD and the “WBINVD exiting” VM-execution control was 1.                                                                                       |
| 55                | XSETBV. Guest software attempted to execute XSETBV.                                                                                                                                           |

# INDEX FOR VOLUMES 3A & 3B

## Numerics

16-bit code, mixing with 32-bit code, 18-1  
32-bit code, mixing with 16-bit code, 18-1  
32-bit physical addressing  
    overview, 3-7  
36-bit physical addressing  
    overview, 3-7  
64-bit mode  
    call gates, 5-20  
    code segment descriptors, 5-5, 9-16  
    control registers, 2-17  
    CR8 register, 2-18  
    D flag, 5-5  
    debug registers, 2-9  
    descriptors, 5-5, 5-7  
    DPL field, 5-5  
    exception handling, 6-22  
    external interrupts, 10-46  
    fast system calls, 5-32  
    GDTR register, 2-16, 2-17  
    GP faults, causes of, 6-52  
    IDTR register, 2-17  
    initialization process, 2-12, 9-14  
    interrupt and trap gates, 6-23  
    interrupt controller, 10-46  
    interrupt descriptors, 2-7  
    interrupt handling, 6-22  
    interrupt stack table, 6-26  
    IRET instruction, 6-25  
    L flag, 3-16, 5-5  
    logical address translation, 3-9  
    MOV CRn, 2-17, 10-46  
    null segment checking, 5-9  
    paging, 2-8  
    reading counters, 2-33  
    reading & writing MSRs, 2-33  
    registers and mode changes, 9-16  
    RFLAGS register, 2-15  
    segment descriptor tables, 3-22, 5-5  
    segment loading instructions, 3-12  
    segments, 3-6  
    stack switching, 5-28, 6-25  
    SYSCALL and SYCRET, 2-10, 5-32  
    SYSENTER and SYSEXIT, 5-31  
    system registers, 2-9  
    task gate, 7-22  
    task priority, 2-25, 10-46  
    task register, 2-17  
    TSS  
        stack pointers, 7-23

    DR7 register, 16-5  
L1 (level 1) cache  
    caching methods, 11-8  
    CPUID feature flag, 11-26  
    description of, 11-5  
    effect of using write-through memory, 11-12  
    introduction of, 19-40  
    invalidating and flushing, 11-25  
    MESI cache protocol, 11-13  
    shared and adaptive mode, 11-26  
L2 (level 2) cache  
    caching methods, 11-8  
    description of, 11-5  
    disabling, 11-25  
    effect of using write-through memory, 11-12  
    introduction of, 19-40  
    invalidating and flushing, 11-25  
    MESI cache protocol, 11-13  
L3 (level 3) cache  
    caching methods, 11-8  
    description of, 11-5  
    disabling and enabling, 11-19, 11-25  
    effect of using write-through memory, 11-12  
    introduction of, 19-42  
    invalidating and flushing, 11-25  
    MESI cache protocol, 11-13  
LAR instruction, 2-30, 5-35  
Larger page sizes  
    introduction of, 19-42  
    support for, 19-26  
Last branch  
    interrupt & exception recording  
        description of, 16-14, 16-32, 16-33, 16-36, 16-37, 16-39, 16-42, 16-44, 16-46  
    record stack, 16-20, 16-21, 16-33, 16-38, 16-40, 16-43, 16-45, B-185, B-186, B-200  
    record top-of-stack pointer, 16-20, 16-33, 16-38, 16-43, 16-45  
LastBranchFromIP MSR, 16-47, 16-48  
LastBranchToIP MSR, 16-47, 16-48  
LastExceptionFromIP MSR, 16-33, 16-41, 16-43, 16-47, 16-48  
LastExceptionToIP MSR, 16-33, 16-41, 16-43, 16-47, 16-48  
LBR (last branch/interrupt/exception) flag, DEBUGCTLMSR MSR, 16-16, 16-38, 16-46, 16-48

**LDR**  
 Logical Destination Register, 10-60, 10-66, 10-67  
**LDS instruction**, 3-11, 5-12  
**LDT**  
 associated with a task, 7-3  
 description of, 2-5, 2-6, 3-21  
 index into with index field of segment selector, 3-9  
 pointer to in TSS, 7-6  
 pointers to exception and interrupt handlers, 6-16  
 segment descriptors in, 3-13  
 segment selector field, TSS, 7-19  
 selecting with TI (table indicator) flag of segment selector, 3-10  
 setting up during initialization, 9-12  
 task switching, 7-12  
 task-gate descriptor, 7-11  
 use in address translation, 3-8  
**LDTR register**  
 description of, 2-5, 2-6, 2-9, 2-16, 3-21  
 IA-32e mode, 2-16  
 limit, 5-7  
 storing, 3-21  
**LE (local exact breakpoint enable) flag**, DR7 register, 16-5, 16-12  
**LENO-LEN3 (Length) fields**, DR7 register, 16-6  
**LES instruction**, 3-11, 5-12, 6-34  
**LFENCE instruction**, 2-21, 8-9, 8-23, 8-24, 8-26  
**LFS instruction**, 3-11, 5-12  
**LGDT instruction**, 2-29, 5-34, 8-25, 9-12, 19-28  
**LGS instruction**, 3-11, 5-12  
**LIDT instruction**, 2-29, 5-34, 6-13, 8-25, 9-11, 17-7, 19-37  
**Limit checking**  
 description of, 5-6  
 pointer offsets are within limits, 5-36  
**Limit field, segment descriptor**, 5-2, 5-6  
**Linear address**  
 description of, 3-8  
 IA-32e mode, 3-9  
 introduction to, 2-8  
**Linear address space**, 3-8  
 defined, 3-1  
 of task, 7-19  
**Link (to previous task) field**, TSS, 6-20  
**Linking tasks**  
 mechanism, 7-16  
 modifying task linkages, 7-18  
**LINT pins**  
 function of, 6-2  
 programming, D-1  
**LLDT instruction**, 2-29, 5-34, 8-25  
**LMSW instruction**, 2-29, 5-34, 22-3, 22-17  
**Local APIC**, 10-55  
 64-bit mode, 10-46  
 APIC\_ID value, 8-49  
 arbitration over the APIC bus, 10-37  
 arbitration over the system bus, 10-37  
 block diagram, 10-6  
 cluster model, 10-34  
 CR8 usage, 10-46  
 current-count register, 10-23  
 description of, 10-1  
 detecting with CPUID, 10-10  
**DFR (destination format register)**, 10-34  
 divide configuration register, 10-23  
 enabling and disabling, 10-10  
 external interrupts, 6-2  
**features**  
 Pentium 4 and Intel Xeon, 19-38  
 Pentium and P6, 19-38  
**focus processor**, 10-37  
**global enable flag**, 10-12  
**IA32\_APIC\_BASE MSR**, 10-11  
**initial-count register**, 10-22, 10-23  
**internal error interrupts**, 10-2  
**interrupt command register (ICR)**, 10-26  
**interrupt destination**, 10-38  
**interrupt distribution mechanism**, 10-36  
**interrupt sources**, 10-2  
**IRR (interrupt request register)**, 10-43  
**I/O APIC**, 10-1  
**local APIC and 82489DX**, 19-37  
**local APIC and I/O APIC**, 10-3, 10-4  
**local vector table (LVT)**, 10-16  
**logical destination mode**, 10-33  
**LVT (local-APIC version register)**, 10-15  
**mapping of resources**, 8-49  
**MDA (message destination address)**, 10-33  
**overview of**, 10-1  
**performance-monitoring counter**, 30-118  
**physical destination mode**, 10-33  
**receiving external interrupts**, 6-2  
**register address map**, 10-8, 10-55  
**shared resources**, 8-49  
**SMI interrupt**, 26-3  
**spurious interrupt**, 10-47  
**spurious-interrupt vector register**, 10-11  
**state after a software (INIT) reset**, 10-15  
**state after INIT-deassert message**, 10-15  
**state after power-up reset**, 10-14  
**state of**, 10-48  
**SVR (spurious-interrupt vector register)**, 10-11  
**timer**, 10-22  
**timer generated interrupts**, 10-2  
**TMR (trigger mode register)**, 10-43  
**valid interrupts**, 10-20  
**version register**, 10-15  
**Local descriptor table register** (see LDTR)  
**Local descriptor table** (see LDT)  
**Local vector table (LVT)**  
 description of, 10-16  
 thermal entry, 14-15  
**Local x2APIC**, 10-45, 10-60, 10-66  
**Local xAPIC ID**, 10-60

## INDEX

LOCK prefix, 2-31, 2-32, 6-34, 8-2, 8-4, 8-5, 8-23, 19-48  
Locked (atomic) operations  
    automatic bus locking, 8-4  
    bus locking, 8-4  
    effects on caches, 8-7  
    loading a segment descriptor, 19-27  
    on IA-32 processors, 19-48  
    overview of, 8-2  
    software-controlled bus locking, 8-5  
LOCK# signal, 2-32, 8-2, 8-4, 8-5, 8-8  
Logical address  
    description of, 3-8  
    IA-32e mode, 3-9  
Logical address space, of task, 7-20  
Logical destination mode, local APIC, 10-33  
Logical processors  
    per physical package, 8-36  
Logical x2APIC ID, 10-66  
low-temperature interrupt enable bit, 14-22, 14-26  
LSL instruction, 2-30, 5-36  
LSS instruction, 3-11, 5-12  
LTR instruction, 2-29, 5-34, 7-9, 8-25, 9-14  
LVT (see Local vector table)

## M

Machine check architecture  
    VMX considerations, 29-15  
Machine-check architecture  
    availability of MCA and exception, 15-24  
    compatibility with Pentium processor, 15-1  
    compound error codes, 15-27  
    CPUID flags, 15-24  
    error codes, 15-26, 15-27  
    error-reporting bank registers, 15-2  
    error-reporting MSRs, 15-5  
    extended machine check state MSRs, 15-13  
    external bus errors, 15-35  
    first introduced, 19-30  
    global MSRs, 15-2, 15-3  
    initialization of, 15-24  
    interpreting error codes, example (P6 family processors), F-1  
    introduction of in IA-32 processors, 19-50  
    logging correctable errors, 15-37, 15-39, 15-45  
    machine-check exception handler, 15-35  
    machine-check exception (#MC), 15-1  
    MSRs, 15-2  
    overview of MCA, 15-1  
    Pentium processor exception handling, 15-37  
    Pentium processor style error reporting, 15-15  
    simple error codes, 15-26  
    VMX considerations, 29-12, 29-13  
    writing machine-check software, 15-35  
Machine-check exception (#MC), 6-63, 15-1, 15-24, 15-35, 19-28, 19-50  
Mapping of shared resources, 8-49

Maskable hardware interrupts  
    description of, 6-5  
    handling with virtual interrupt mechanism, 17-22  
    masking, 2-13, 6-9  
MCA flag, CPUID instruction, 15-24  
MCE flag, CPUID instruction, 15-24  
MCE (machine-check enable) flag  
    CR4 control register, 2-24, 19-24  
MDA (message destination address)  
    local APIC, 10-33  
Memory, 11-1  
Memory management  
    introduction to, 2-8  
    overview, 3-1  
    paging, 3-1, 3-2  
    registers, 2-15  
    segments, 3-1, 3-2, 3-3, 3-9  
    virtualization of, 28-3  
Memory ordering  
    in IA-32 processors, 19-46  
    out of order stores for string operations, 8-18  
    overview, 8-8  
    processor ordering, 8-8  
    strengthening or weakening, 8-23  
    write ordering, 8-8  
Memory type range registers (see MTRRs)  
Memory types  
    caching methods, defined, 11-8  
    choosing, 11-12  
    MTRR types, 11-30  
    selecting for Pentium III and Pentium 4 processors, 11-21  
    selecting for Pentium Pro and Pentium II processors, 11-20  
    UC (strong uncacheable), 11-8  
    UC- (uncacheable), 11-9  
    WB (write back), 11-10  
    WC (write combining), 11-9  
    WP (write protected), 11-10  
    writing values across pages with different memory types, 11-23  
    WT (write through), 11-10  
MemTypeGet() function, 11-42  
MemTypeSet() function, 11-44  
MESI cache protocol, 11-7, 11-13  
Message address register, 10-50  
Message data register format, 10-51  
Message signalled interrupts  
    message address register, 10-49  
    message data register format, 10-49  
MFENCE instruction, 2-21, 8-9, 8-23, 8-24, 8-26  
Microcode update facilities  
    authenticating an update, 9-48  
    BIOS responsibilities, 9-49  
    calling program responsibilities, 9-52  
    checksum, 9-44  
    extended signature table, 9-41  
    family OFH processors, 9-37

    - segmented addressing, 1-8
  - NT (nested task) flag
    - EFLAGS register, 2-13, 7-13, 7-16

Null segment selector, checking for, 5-9  
 Numeric overflow exception (#O), 19-13  
 Numeric underflow exception (#U), 19-14  
 NV (invert) flag, PerfEvtSel0 MSR  
 (P6 family processors), 30-6, 30-116  
 NW (not write-through) flag  
 CRO control register, 2-20, 9-8, 11-17, 11-18,  
 11-24, 11-46, 11-47, 19-25, 19-26, 19-40  
 NXE bit, 5-43

**O**  
 Obsolete instructions, 19-7, 19-20  
 OF flag, EFLAGS register, 6-32  
 On-die digital thermal sensor, 14-19  
 relevant MSRs, 14-19  
 sensor enumeration, 14-19  
 On-Demand  
 clock modulation enable bits, 14-17  
 On-demand  
 clock modulation duty cycle bits, 14-17  
 On-die sensors, 14-11  
 Opcodes  
 undefined, 19-7  
 Operands  
 instruction, 1-8  
 operand-size prefix, 18-2  
 Operating modes  
 64-bit mode, 2-10  
 compatibility mode, 2-10  
 IA-32e mode, 2-10, 2-11  
 introduction to, 2-10  
 protected mode, 2-10  
 SMM (system management mode), 2-10  
 transitions between, 2-11, 13-17  
 virtual-8086 mode, 2-11  
 VMX operation  
 enabling and entering, 20-4  
 guest environments, 27-1  
 OR instruction, 8-5  
 OS (operating system mode) flag  
 PerfEvtSel0 and PerfEvtSel1 MSRs (P6 only),  
 30-5, 30-116  
 OSFXSR (FXSAVE/FXRSTOR support) flag  
 CR4 control register, 2-24, 9-10, 13-3  
 OSXMMEXCPT (SIMD floating-point exception  
 support) flag, CR4 control register, 2-25,  
 6-65, 9-10, 13-3  
 OUT instruction, 8-23, 22-3  
 Out-of-spec status bit, 14-20, 14-25  
 Out-of-spec status log, 14-20, 14-25  
 OUTS/OUTSB/OUTSW/OUTSD instruction, 16-12,  
 22-3  
 Overflow exception (#OF), 6-32  
 Overheat interrupt enable bit, 14-22, 14-26

**P**  
 P (present) flag  
 page-directory entry, 6-54  
 page-table entry, 6-54  
 segment descriptor, 3-14  
 P5\_MC\_ADDR MSR, 15-15, 15-37, B-45, B-66, B-82,  
 B-135, B-208, B-222, B-231, B-243  
 P5\_MC\_TYPE MSR, 15-15, 15-37, B-45, B-66, B-82,  
 B-135, B-208, B-222, B-231, B-243  
 P6 family processors  
 compatibility with FP software, 19-9  
 description of, 1-1  
 last branch, interrupt, and exception recording,  
 16-46  
 list of performance-monitoring events, A-254  
 MSR supported by, B-231  
 PAE paging  
 feature flag, CR4 register, 2-23  
 flag, CR4 control register, 3-7, 19-24, 19-25  
 Page attribute table (PAT)  
 compatibility with earlier IA-32 processors, 11-52  
 detecting support for, 11-48  
 IA32\_CR\_PAT MSR, 11-49  
 introduction to, 11-48  
 memory types that can be encoded with, 11-49  
 MSR, 11-19  
 precedence of cache controls, 11-20  
 programming, 11-50  
 selecting a memory type with, 11-50  
 Page directories, 2-8  
 Page directory  
 base address (PDBR), 7-6  
 introduction to, 2-8  
 overview, 3-2  
 setting up during initialization, 9-13  
 Page directory pointers, 2-8  
 Page frame (see Page)  
 Page tables, 2-8  
 introduction to, 2-8  
 overview, 3-2  
 setting up during initialization, 9-13  
 Page-directory entries, 8-5, 11-6  
 Page-fault exception (#PF), 4-63, 6-54, 19-29  
 Pages  
 disabling protection of, 5-1  
 enabling protection of, 5-1  
 introduction to, 2-8  
 overview, 3-2  
 PG flag, CRO control register, 5-2  
 split, 19-21  
 Page-table entries, 8-5, 11-6, 11-27  
 Paging  
 combining segment and page-level protection,  
 5-41  
 combining with segmentation, 3-7  
 defined, 3-1  
 IA-32e mode, 2-8  
 initializing, 9-13

## INDEX

- introduction to, 2-8
- large page size MTRR considerations, 11-47
- mapping segments to pages, 4-64
- page boundaries regarding TSS, 7-6
- page-fault exception, 6-54
- page-level protection, 5-2, 5-5, 5-39
- page-level protection flags, 5-40
- virtual-8086 tasks, 17-10
- Parameter
  - passing, between 16- and 32-bit call gates, 18-8
  - translation, between 16- and 32-bit code segments, 18-8
- PAUSE instruction, 2-21, 22-4
- PBi (performance monitoring/breakpoint pins) flags, DEBUGCTLMSR MSR, 16-44, 16-47
- PC (pin control) flag, PerfEvtSel0 and PerfEvtSel1 MSRs (P6 family processors), 30-6, 30-116
- PC0 and PC1 (pin control) fields, CESR MSR (Pentium processor), 30-120
- PCD pin (Pentium processor), 11-19
- PCD (page-level cache disable) flag
  - CR3 control register, 2-22, 11-19, 19-25, 19-41
  - page-directory entries, 9-8, 11-19, 11-47
  - page-table entries, 9-8, 11-19, 11-47, 19-42
- PCE (performance monitoring counter enable) flag, CR4 control register, 2-24, 5-34, 30-72, 30-117
- PCE (performance-monitoring counter enable) flag, CR4 control register, 19-24
- PDBR (see CR3 control register)

## T

- T (debug trap) flag, TSS, 7-6
- Task gates
  - descriptor, 7-11
  - executing a task, 7-3
  - handling a virtual-8086 mode interrupt or exception through, 17-21
  - IA-32e mode, 2-7
  - in IDT, 6-14
  - introduction for IA-32e, 2-6

introduction to, 2-5, 2-6, 2-7  
 layout of, 6-14  
 referencing of TSS descriptor, 6-20  
**Task management**, 7-1  
 data structures, 7-4  
 mechanism, description of, 7-3  
**Task register**, 3-21  
 description of, 2-17, 7-1, 7-9  
 IA-32e mode, 2-17  
 initializing, 9-14  
 introduction to, 2-9  
**Task switching**  
 description of, 7-3  
 exception condition, 16-13  
 operation, 7-13  
 preventing recursive task switching, 7-18  
 saving MMX state on, 12-5  
 saving SSE/SSE2/SSE3 state  
     on task or context switches, 13-9  
 T (debug trap) flag, 7-6  
**Tasks**  
 address space, 7-19  
 description of, 7-1  
 exception-handler task, 6-16  
 executing, 7-3  
 Intel 286 processor tasks, 19-51  
 interrupt-handler task, 6-16  
 interrupts and exceptions, 6-20  
 linking, 7-16  
 logical address space, 7-20  
 management, 7-1  
 mapping linear and physical address space, 7-19  
 restart following an exception or interrupt, 6-7  
 state (context), 7-2, 7-3  
 structure, 7-1  
 switching, 7-3  
 task management data structures, 7-4  
**TF (trap) flag, EFLAGS register**, 2-12, 6-19, 16-12,  
     16-15, 16-39, 16-42, 16-44, 16-47, 17-6,  
     17-29, 26-14  
**Thermal monitoring**  
 advanced power management, 14-9  
 automatic, 14-12  
 automatic thermal monitoring, 14-10  
 catastrophic shutdown detector, 14-10, 14-12  
 clock-modulation bits, 14-17  
 C-state, 14-9  
 detection of facilities, 14-18  
 Enhanced Intel SpeedStep Technology, 14-1  
**IA32\_APERF MSR**, 14-2  
**IA32\_MPERF MSR**, 14-2  
**IA32\_THERM\_INTERRUPT MSR**, 14-19  
**IA32\_THERM\_STATUS MSR**, 14-19  
 interrupt enable/disable flags, 14-15  
 interrupt mechanisms, 14-11  
 MWAIT extensions for, 14-9  
 on die sensors, 14-11, 14-19  
 overview of, 14-1, 14-10  
 performance state transitions, 14-14  
 sensor interrupt, 10-2  
 setting thermal thresholds, 14-19  
 software controlled clock modulation, 14-11,  
     14-16  
 status flags, 14-14  
 status information, 14-14, 14-16  
 stop clock mechanism, 14-11  
 thermal monitor 1 (TM1), 14-12  
 thermal monitor 2 (TM2), 14-12  
 TM flag, CPUID instruction, 14-18  
**Thermal status bit**, 14-19, 14-24  
**Thermal status log bit**, 14-19, 14-24  
**Thermal threshold #1 log**, 14-20, 14-25  
**Thermal threshold #1 status**, 14-20, 14-25  
**Thermal threshold #2 log**, 14-21, 14-25  
**Thermal threshold #2 status**, 14-21, 14-25  
**THERMTrip# interrupt enable bit**, 14-22, 14-26  
**thread timeout indicator**, E-5, E-11, E-15, E-18  
**Threshold #1 interrupt enable bit**, 14-23, 14-27  
**Threshold #1 value**, 14-22, 14-26  
**Threshold #2 interrupt enable**, 14-23, 14-27  
**Threshold #2 value**, 14-23, 14-27  
**TI (table indicator) flag, segment selector**, 3-10  
**Timer, local APIC**, 10-22  
**Time-stamp counter**  
 counting clockticks, 30-96  
 description of, 16-49  
**IA32\_TIME\_STAMP\_COUNTER MSR**, 16-49  
**RDTSC instruction**, 16-49  
 reading, 2-32  
 software drivers for, 30-118  
**TSC flag**, 16-49  
**TSD flag**, 16-49  
**TLBs**  
 description of, 11-1, 11-6  
 flushing, 11-29  
 invalidating (flushing), 2-31  
 relationship to PGE flag, 19-26  
 relationship to PSE flag, 11-29  
 virtual TLBs, 28-5  
**TM1 and TM2**  
 See: thermal monitoring, 14-12  
**TMR**  
 Trigger Mode Register, 10-45, 10-56, 10-60,  
     10-68  
**TMR (Trigger Mode Register), local APIC**, 10-43  
**TPR**  
 Task Priority Register, 10-55, 10-60  
**TR (trace message enable) flag**  
 DEBUGCTLMSR MSR, 16-15, 16-39, 16-42, 16-45,  
     16-47  
**Trace cache**, 11-6  
**Transcendental instruction accuracy**, 19-10, 19-20  
**Translation lookaside buffer (see TLB)**  
**Trap gates**  
 difference between interrupt and trap gates,  
     6-19

## INDEX

- for 16-bit and 32-bit code modules, 18-2  
handling a virtual-8086 mode interrupt or exception through, 17-18  
in IDT, 6-14  
introduction for IA-32e, 2-6  
introduction to, 2-5, 2-7  
layout of, 6-14
- Traps**  
description of, 6-6  
restarting a program or task after, 6-7
- TS (task switched) flag**  
CR0 control register, 2-20, 2-30, 6-36, 12-1, 13-4, 13-10
- TSD (time-stamp counter disable) flag**  
CR4 control register, 2-23, 5-34, 16-50, 19-24
- TSS**  
16-bit TSS, structure of, 7-21  
32-bit TSS, structure of, 7-4  
64-bit mode, 7-22  
CR3 control register (PDBR), 7-5, 7-19  
description of, 2-5, 2-6, 7-1, 7-4  
EFLAGS register, 7-5  
EFLAGS.NT, 7-16  
EIP, 7-6  
executing a task, 7-3  
floating-point save area, 19-16  
format in 64-bit mode, 7-22  
general-purpose registers, 7-5  
IA-32e mode, 2-7  
initialization for multitasking, 9-14  
interrupt stack table, 7-23  
invalid TSS exception, 6-42  
IRET instruction, 7-16  
I/O map base address field, 7-6, 19-39  
I/O permission bit map, 7-6, 7-23  
LDT segment selector field, 7-6, 7-19  
link field, 6-20  
order of reads/writes to, 19-39  
pointed to by task-gate descriptor, 7-11  
previous task link field, 7-6, 7-16, 7-18  
privilege-level 0, 1, and 2 stacks, 5-26  
referenced by task gate, 6-20  
segment registers, 7-5  
T (debug trap) flag, 7-6  
task register, 7-9  
using 16-bit TSSs in a 32-bit environment, 19-39  
virtual-mode extensions, 19-39
- TSS descriptor**  
B (busy) flag, 7-7  
busy flag, 7-18  
initialization for multitasking, 9-14  
structure of, 7-7, 7-8
- TSS segment selector**  
field, task-gate descriptor, 7-11  
writes, 19-39
- Type**  
checking, 5-7  
field, IA32\_MTRR\_DEF\_TYPE MSR, 11-33
- field, IA32\_MTRR\_PHYSBASEn MTRR, 11-35, 11-37  
field, segment descriptor, 3-14, 3-16, 3-19, 5-2, 5-7  
of segment, 5-7
- U**
- UC- (uncacheable) memory type, 11-9  
UD2 instruction, 19-6  
Uncached (UC-) memory type, 11-12  
Uncached (UC) memory type (see Strong uncached (UC) memory type)  
Undefined opcodes, 19-7  
Unit mask field, PerfEvtSel0 and PerfEvtSel1 MSRs (P6 family processors), 30-5, 30-7, 30-8, 30-9, 30-10, 30-11, 30-12, 30-13, 30-20, 30-21, 30-22, 30-37, 30-40, 30-50, 30-51, 30-52, 30-116
